

## **TERNA: INFORMATIVE EVENT ON THE IMPLEMENTATION PLAN OF THE NEW MOENA-CAMPITELLO (PROVINCE OF TRENTO) UNDERGROUND POWER LINE**

**The event will be held on Monday 19 June at the Council Room of the Municipality of San Giovanni di Fassa**

**A €48 million investment to increase the security and resilience of the area's electricity grid**

**The works are part of Terna's plan to guarantee the regular performance of the Milan-Cortina 2026 Olympic Games**

**Rome, 16 June 2023** - On Monday 19 June an information session will be held by Terna, the Italian national transmission grid operator led by Giuseppina Di Foggia, to present the implementation plan of the new Moena-Campitello underground power line to citizens in municipalities within the Autonomous Province of Trento.

From 4pm to 8pm at the Council Room of the Municipality of San Giovanni di Fassa, Terna technicians will present the executive plan for the new underground power line that will run through the municipalities of Moena, Soraga, San Giovanni di Fassa, Mazzin and Campitello in Val di Fassa to local residents. Specifically, the technicians will provide details on the project's schedules and construction methods, and will be available to answer questions from the local community about the new infrastructure and the construction works scheduled to begin in July. The works will be carried out in coordination with local authorities to ensure minimum interference with local vehicular traffic and prevent disruption to tourism.

Meetings with citizens are another key element of the participatory planning process undertaken by Terna with the region, in coordination with the Autonomous Province of Trento. In fact, engaging in dialogue with all interested parties during the past months has helped to identify shared project solutions and reduce authorisation times.

The project, in which Terna will invest €48 million, is one of the main projects planned by the company to increase energy reliability at the Milan-Cortina 2026 Olympic and Paralympic Games. The project involves the construction of 19 km of new underground power lines that will connect the Primary Cabins of Moena and Campitello, owned by the local distributor, with the new Terna Electrical Substation in the Municipality of Moena. The latter will be built using compact gas-insulated technology architecturally in-keeping with the surrounding landscape to maintain the beauty that Val di Fassa is known for. The new infrastructure will improve the security of supply and the resilience of the local grid, which in recent years has been affected by frequent extreme weather events.

With an investment of over €200 million, Terna has planned a total of 12 projects to be carried out in Lombardy, Trentino-Alto Adige and Veneto, regions that will host the 2026 Winter Olympics. Overall, the projects involve over 130 km of new underground cables with a low environmental impact.
