ASX Announcement: 09 May 2022

Stunning Drill Result from Greater Duchess Project – Carnaby Resources Limited

---

DiscovEx Resources Limited (**Company or DiscovEx**) provides the attached announcement by Carnaby Resources Limited (ASX: CNB) (Carnaby) as it relates to the Greater Duchess Project.

The announcement relates to the Southern Hub Tenements, located in the Mt. Isa Region of Queensland where DiscovEx holds a 17.5% free-carried interest in EPM 9083, EPM 11013, EPM 14366, EPM 14369, EPM 17637, EPM 18223, EPM 18990, EPM 19008, EPM 25435, EPM 25439, EPM 25853, EPM 25972.

DISCOVEX RESOURCES LIMITED

STUNNING DRILL RESULTS FROM GREATER DUCHESS PROJECT

68m @ 2.4% Cu, 0.4g/t Au from 40m

Inc. 42m @ 3.6% Cu, 0.5 g/t Au

Carnaby Resources Limited (ASX: CNB) (**Carnaby** or the **Company**) is pleased to announce new exploration results at the Greater Duchess Copper Gold Project in Mt Isa, Queensland.

Highlights

- **Lady Fanny Prospect:**
  - **LFRC120 has intersected the widest high grade intercept to date with a result of 68m @ 2.4% copper, 0.4 g/t gold from 40m including 42m @ 3.6% copper, 0.5 g/t gold from 63m.**
  - **Wide, high grade and very shallow copper gold mineralisation now been intersected over a core zone of over 300m strike length which remains strongly open.**
  - **Numerous other new results and visual intersections have been received including a 30m zone of very strong copper sulphides intersected in LFRC129 (RESULTS PENDING).**
- **Nil Desperandum Prospect:**
  - **NLDD086 has confirmed in diamond core drilling the high grade breccia shoot orientation, geometry and true thickness in the discovery RC hole NLDD044. Hole NLDD086 intersected 33m @ 4.0% copper, 0.5 g/t gold from 264m including 18m @ 6.7% copper, 0.8 g/t gold.**
  - **The high grade breccia shoot discovery has been extended a further 180m downplunge. Results include 26m @ 2.4% copper, 0.3 g/t gold in NLDD080 and 17m @ 2.2% copper, 0.4 g/t gold in NLDD082. Extensional drilling is ongoing.**

The Company's Managing Director, Rob Watkins commented:

"These stunning drill results clearly demonstrate the resource and development potential of the Greater Duchess Copper Gold Project. We are discovering and building a pipeline of exceptional and highly desirable copper gold deposits whose intrinsic value will only grow over time as we define and grow the maiden resource and move towards a development timetable."

Company Highlights

- Proven and highly credentialed management team
- Tight capital structure and strong cash position
- Nil Desperandum and Lady Fanny Iron Oxide Copper Gold discoveries within the Greater Duchess Copper Gold Project, Mt Isa inlier, Queensland.
- Greater Duchess Copper Gold Project, numerous camp scale IOCG deposits over 1,022 km^2 of tenure
- Projects near to De Grey's Hemi gold discovery on 442 km^2 of highly prospective tenure
- 100% ownership of the Tick Hill Gold Project (granted ML's) in Qld, historically one of Australia highest grade and most profitable gold mines producing 511 koz at 22 g/t gold

GREATER DUCHESS COPPER GOLD PROJECT

New Reverse Circulation and Diamond Drilling results and further visual estimations from ongoing drilling at the Lady Fanny and Nil Desperandum copper gold discoveries are presented below and in Tables 1 & 2 of Appendix 1.

Drilling continues with two drill rigs, a dedicated RC and a dedicated Diamond Drill rig.

A major new program of Induced Polarisation (IP) surveys will commence next week targeting the highly prospective three-kilometre corridor between Nil Desperandum and Lady Fanny and the northern extension of Lady Fanny (Figure 6). Additional IP surveys will also be completed at Duchess and at Mount Hope.

LADY FANNY PROSPECT (CNB 100%)

Stunning drill results and visual intersections continue to be received from RC drilling at the Lady Fanny discovery as detailed below (Figure 1 & 2). The first diamond drill hole (LFDD126) has been completed at Lady Fanny, intersecting broad zones of copper gold mineralisation and confirming that the mineralisation is hosted concordantly within a large steeply dipping shear zone (Results Pending).

Wide, high grade and very shallow copper gold mineralisation has now been intersected over a core zone of over 300m strike length which remains strongly open to the north and at depth.

The Lady Fanny discovery is continuing to show exceptional potential for a large open pittable resource which continues to grow with ongoing drilling.

LFRC120

A stunning result has been received from LFRC120 of;

68m @ 2.4% copper, 0.4 g/t gold from 40m

Including 42m @ 3.6% copper, 0.5 g/t gold from 63m

Including 9m @ 7.8% copper, 1.5 g/t gold from 63m

LFRC120 is the first of a series of new drill holes to test the central workings area where difficult drill pad access caused by high topographic relief and numerous shallow historical workings resulted in delayed access. The result in LFRC120 links to the previously reported high grade results to the south hosted in a steeply dipping shear zone.

Wide and high grade copper gold mineralisation has now been defined over a greater than 300m strike length with mineralisation outcropping at surface and in shallow historical workings mined at the turn of the century and in the late 1960's and early 1970's.

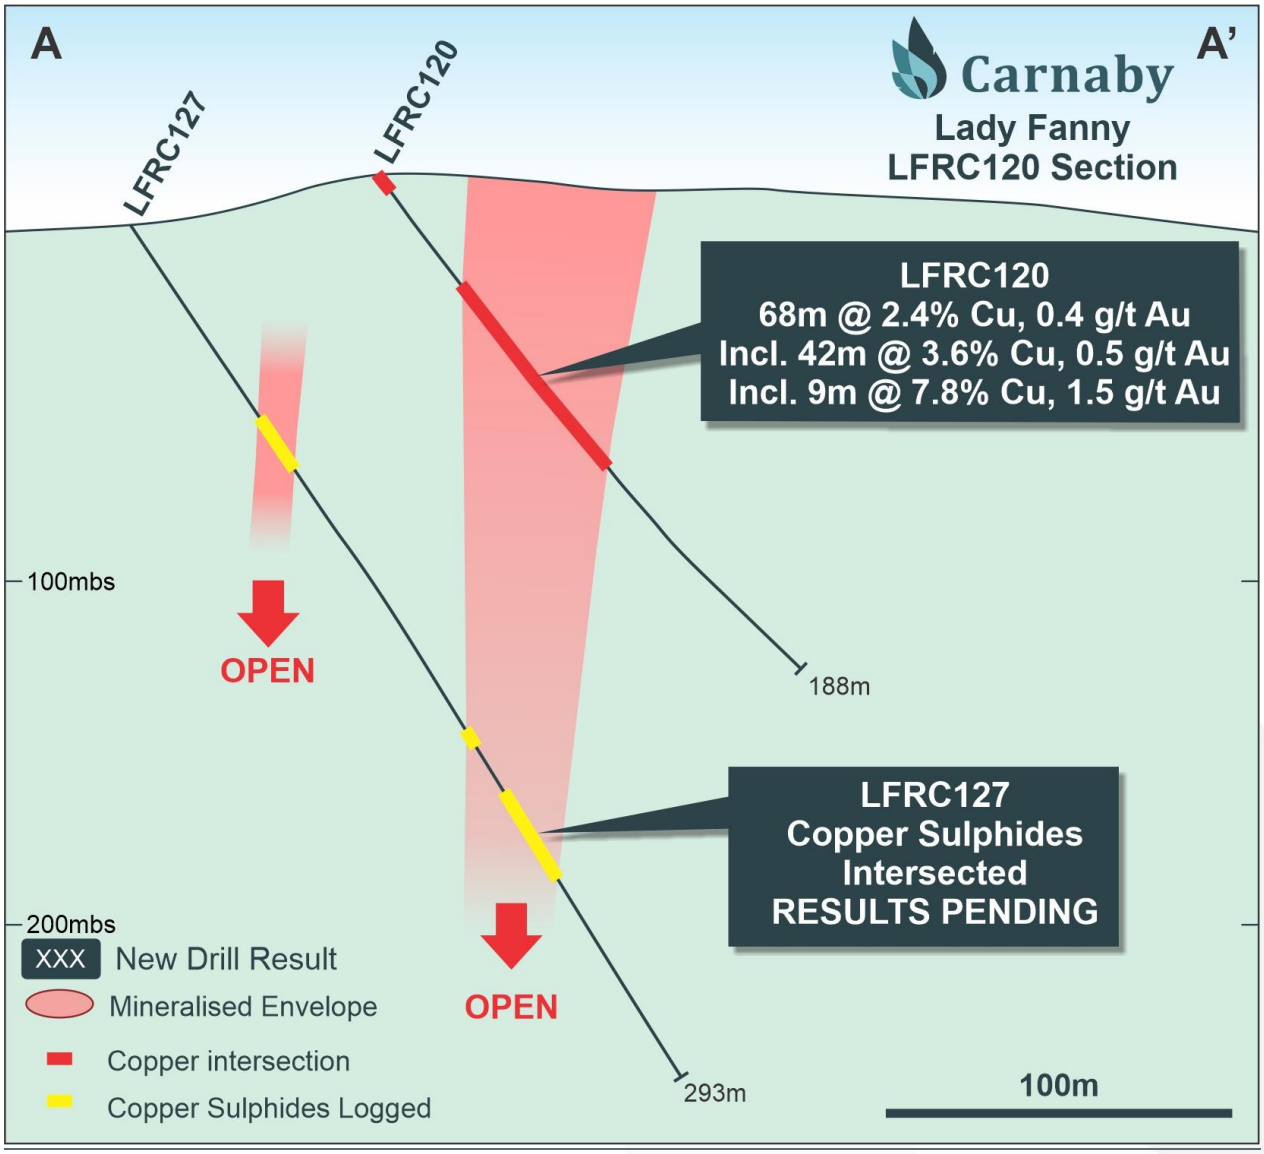

Figure 1. Lady Fanny RC Drill Section Showing Drill Hole LFRC120.

LFRC129

LFRC129 was drilled 60m north of the stunning drill result in LFRC120 above (Figure 2).

LFRC129 has intersected a ~30m downhole interval very strong zone of copper sulphides from 66m to 96m with results pending (see photo below). Visual logging of copper sulphide (chalcopyrite) percentages from this hole and all other holes where assays have not yet been received is presented in Appendix 1, Table 2.

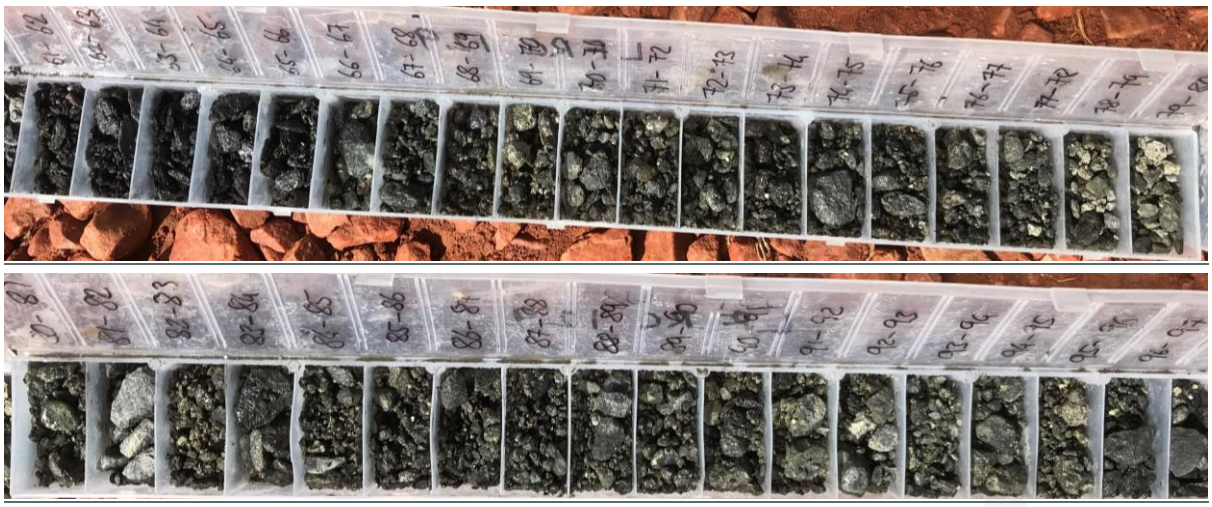

Photo of copper sulphides intersected in LFRC129

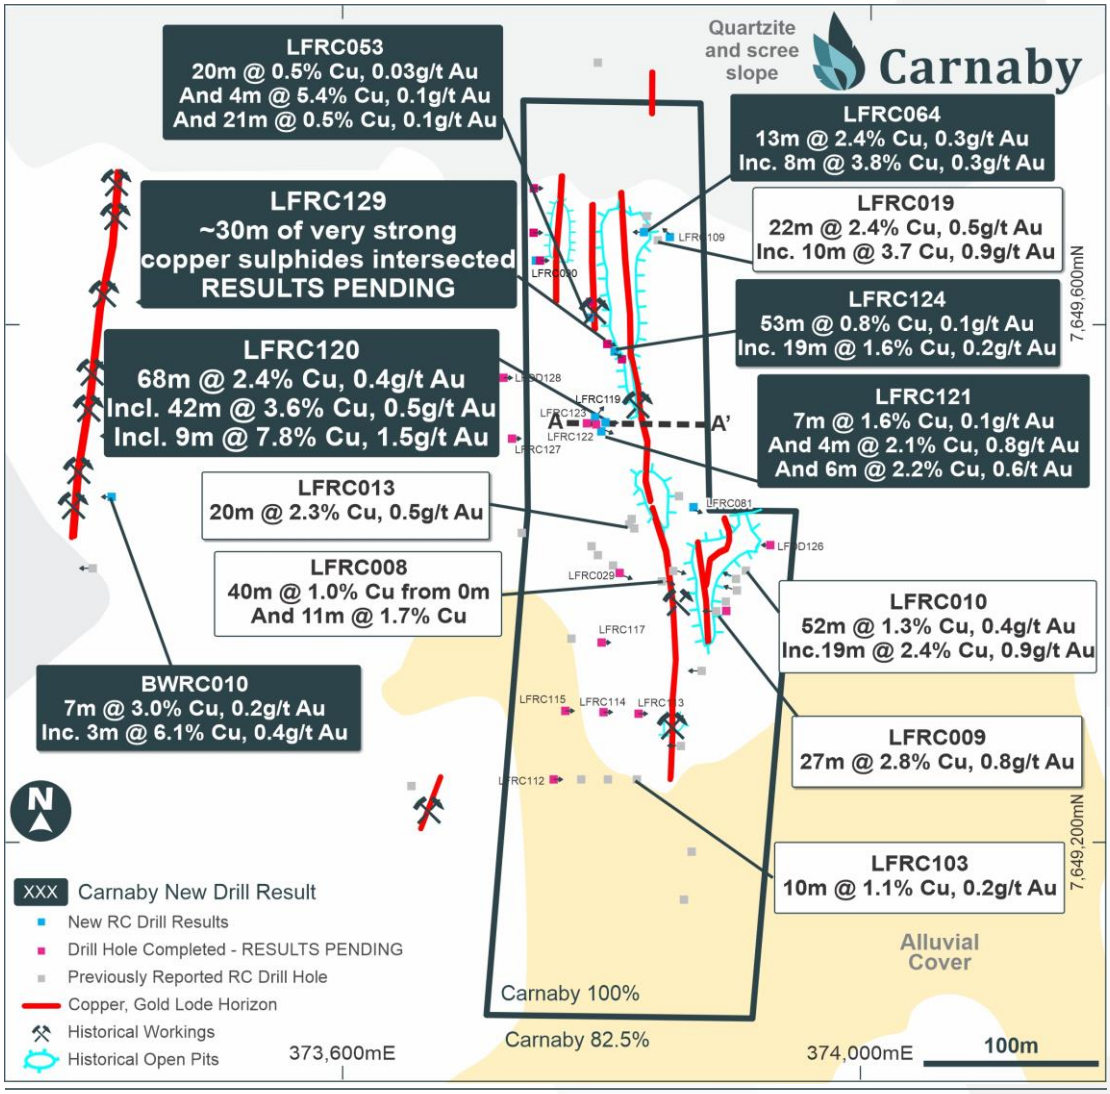

Figure 2. Lady Fanny Plan Showing Location of New RC Drill Results.

LFRC064

LFRC064 was drilled up dip from a previously released result of 22m @ 2.4% copper intersected in LFRC019. The results in LFRC019 and LFRC064 represent the northern most defined extent of shallow, wide and high grade copper mineralisation (Figure 2). Drilling is currently focussing on extending the high grade copper mineralisation to the north, where a large IP chargeability anomaly is located.

LFRC064 intersected;

13m @ 2.4% copper, 0.3 g/t gold from 21m

Including 8m @ 3.8% copper, 0.3 g/t gold from 26m

LFRC124

LFRC124 was also collared 60m north of LFRC120 and was drilled up dip from the visual copper sulphide intersection on LFRC129 indicating a steep west dip to the mineralisation. LFRC124 intersected;

53m @ 0.8% copper, 0.1 g/t gold from 36m

Including 19m @ 1.6% copper, 0.2 g/t gold from 37m

LFRC119, 121-123

Four other RC holes were fanned out from the same drill pad as LFRC120 due to the difficult access and high topographic relief making it difficult to establish regularly spaced east west drill traverses. Results have been received from LFRC119 and LFRC121 are presented in Table 1. Not all holes tested the main mineralised shear zone. Results from the other two holes LFRC122-123 are pending.

LFRC121 intersected;

7m @ 1.6% copper, 0.2 g/t gold from 68m

Including 2m @ 5.0% copper, 0.4 g/t gold from 69m

11m @ 0.9% copper, 0.3 g/t gold from 87m

Including 4m @ 2.1% copper, 0.8 g/t gold from 87m

16m @ 1.3% copper, 0.3 g/t gold from 136m

Including 6m @ 2.2% copper, 0.6 g/t gold from 146m

BURKE & WILLS PROSPECT (CNB 82.5%, DCX 17.5%)

A total of five RC holes have been drilled along the Burke & Wills shallow historical workings with new results received for BWRC010 which intersected **7m @ 3.0% copper**, 0.2 g/t gold from 46m including **3m @ 6.1% copper**, 0.4 g/t gold from 47m (Figure 2). Every RC hole drilled has intersected shallow high grade copper gold mineralisation of similar grade indicating excellent continuity of the mineralisation. The drilling completed to date has defined steeply east dipping shallow copper mineralisation over greater than 200m strike and completely open in all directions.

NIL DESPERANDUM PROSPECT (CNB 82.5%, DCX 17.5%)

Ongoing diamond drilling continues to extend the high grade discovery down plunge where it still remains completely open (Figure 3). The excellent continuity, width, grade and geometry of the high grade breccia shoot remains highly encouraging for future resource and development potential.

The new diamond drill results reported below have extended the high grade breccia shoot discovery by approximately 180m which has now been drill defined over a 300m downplunge extent. Combined with the breccia shoot previously defined to surface, the drilling to date has defined high grade breccia hosted copper gold mineralisation over a down plunge extent of over 600m. The high grade breccia zone remains completely open at depth.

NLDD086

Diamond drill hole NLDD086 was drilled as an angled hole to confirm the geometry, dip and western boundary of the spectacular discovery hole breccia shoot intersected in NLDD044 of 41m @ 4.1% copper (see ASX release 29 December 2021). NLDD086 has confirmed the previously interpreted geometry, dip and true thickness of the breccia shoot hosted in a SSW plunging and moderately SE dipping structure.

NLDD086 intersected;

33m @ 4.0% copper, 0.5 g/t gold from 264m

Including 27m @ 5.0% copper, 0.6 g/t gold from 271m

Including 18m @ 6.7% copper, 0.8 g/t gold from 274m

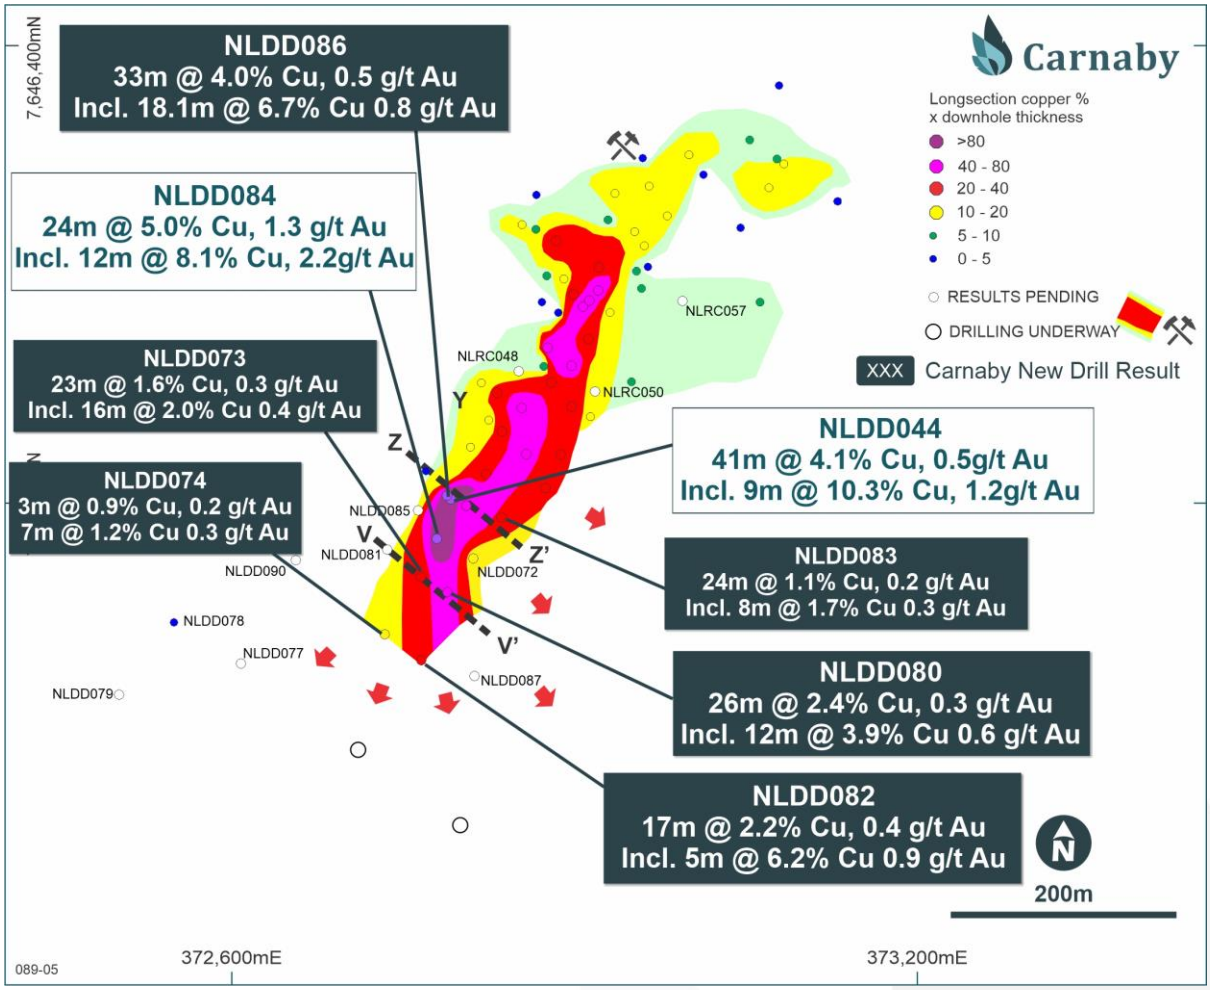

Figure 3. Nil Desperandum Drill Hole Pierce Point Plan coloured by copper % times down hole width and showing location of new results.

NLDD086 was also drilled to test for steep dipping structures interpreted to exist but not evident in previous vertical drill holes. NLDD086 did intersect late brittle fault structures bounding the breccia shoot lode. These faults are considered to have formed post mineralisation. The presence of these late brittle faults, as indicated in Figure 4, is not unexpected and is evidence of a long-lived structure. Similar type faults are also found bounding the nearby Tick Hill gold deposit.

The new drill result in NLDD083 (Figure 4) is interpreted to represent the down plunge extension of the initially defined breccia shoot that has been drilled from surface to over 400m down plunge. It is interpreted that this breccia mineralisation is linked to the high grade breccia shoot discovery potentially offset by a late structure as indicated in Figure 4.

Further detailed structural analysis is underway to better define the controls of the high grade breccia shoots to aid in targeting further extensions and repetitions.

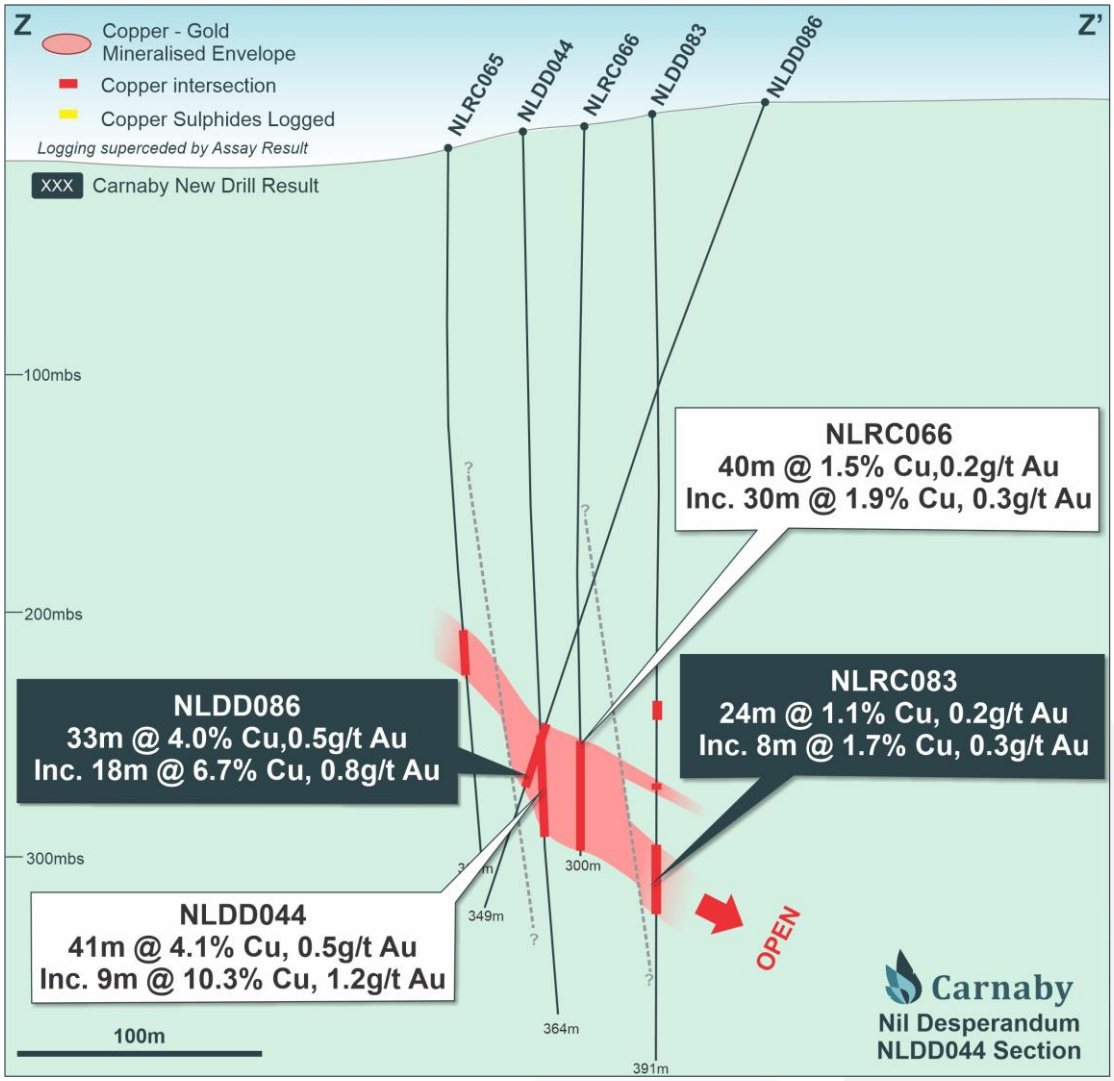

Figure 4. NLDD086 drill section.

NLDD073 & NLDD080

Diamond drill holes NLDD073 and NLDD080 intersected the breccia shoot approximately 75m down plunge from a previously reported result of 24m @ 5.0% copper, 1.3 g/t gold in NLDD084 (see ASX release 4 April 2022). Both new holes intersected broad zones of high grade copper gold mineralisation in the southeast dipping breccia shoot, again confirming excellent widths and down plunge continuity of the breccia hosted mineralisation (Figure 3 & 5).

Results from NLDD073 and NLDD080 are summarised as;

NLDD073 **23m @ 1.6% copper, 0.3 g/t gold from 367m**

Including 16m @ 2.0% copper, 0.4 g/t gold from 373m

NLDD080 **26m @ 2.4% copper, 0.3 g/t gold from 381m**

Including 12m @ 3.9% copper, 0.6 g/t gold from 382m

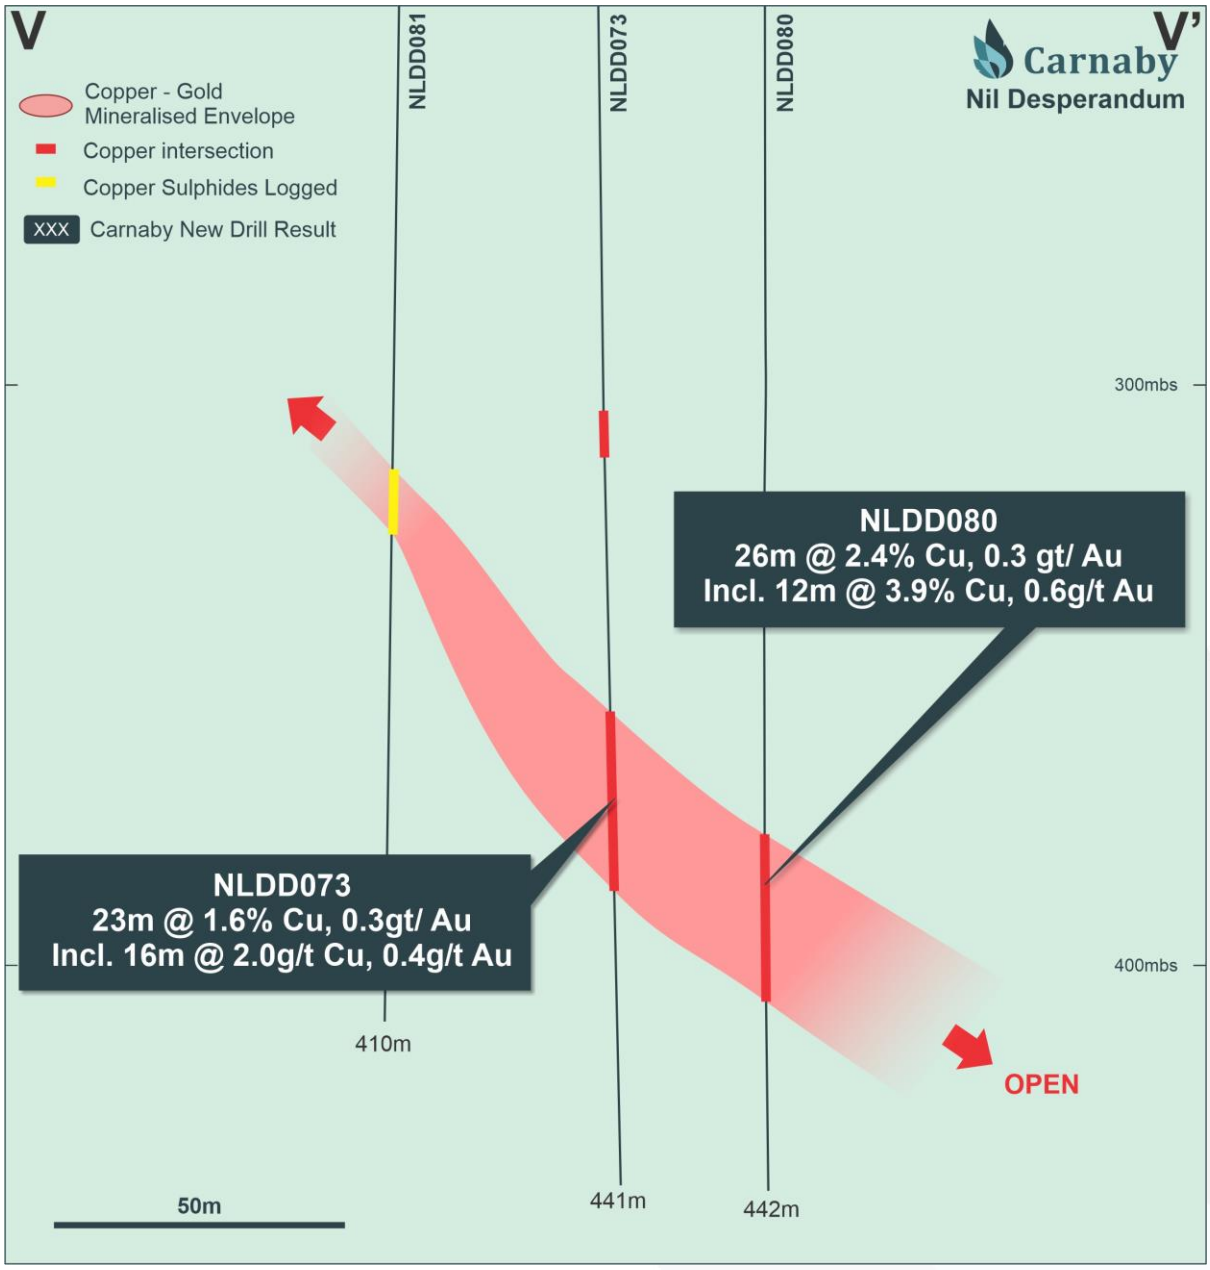

Figure 5. NLDD073 and NLDD080 drill section showing the new results.

NLDD082

Diamond drill hole NLDD082 has extended the Nil Desperandum high grade breccia shoot discovery by approximately 180m down plunge from a previously reported result of 24m @ 5.0% copper, 1.3 g/t gold in NLDD084 and to over 300m down plunge overall. The result in

NLDD082 remains completely open at depth and is currently being followed up with two extensional drill holes as shown in Figure 3.

Results from NLDD082 are summarised as;

NLDD082 **17m @ 2.2% copper, 0.4 g/t gold from 453m**

Including 11m @ 3.1% copper, 0.6 g/t gold from 458m

Including 5m @ 6.2% copper, 0.9 g/t gold from 465m

NLDD078

Diamond drill hole NLDD078 targeted an IP chargeability anomaly approximately 200m southwest of the main high grade breccia shoot discovery (Figure 3). The drill hole intersected several zones of favourable host rock biotite schist and extensive alteration. Copper sulphide mineralisation was intersected in a steeply dipping structure recording a downhole intercept of 5m @ 0.4% copper from 408m. Results from nearby hole NLDD077 also targeting the IP anomaly are awaited. The source of the IP chargeability anomaly is yet to be explained and angled drilling will be completed to target potential steeply dipping mineralisation.

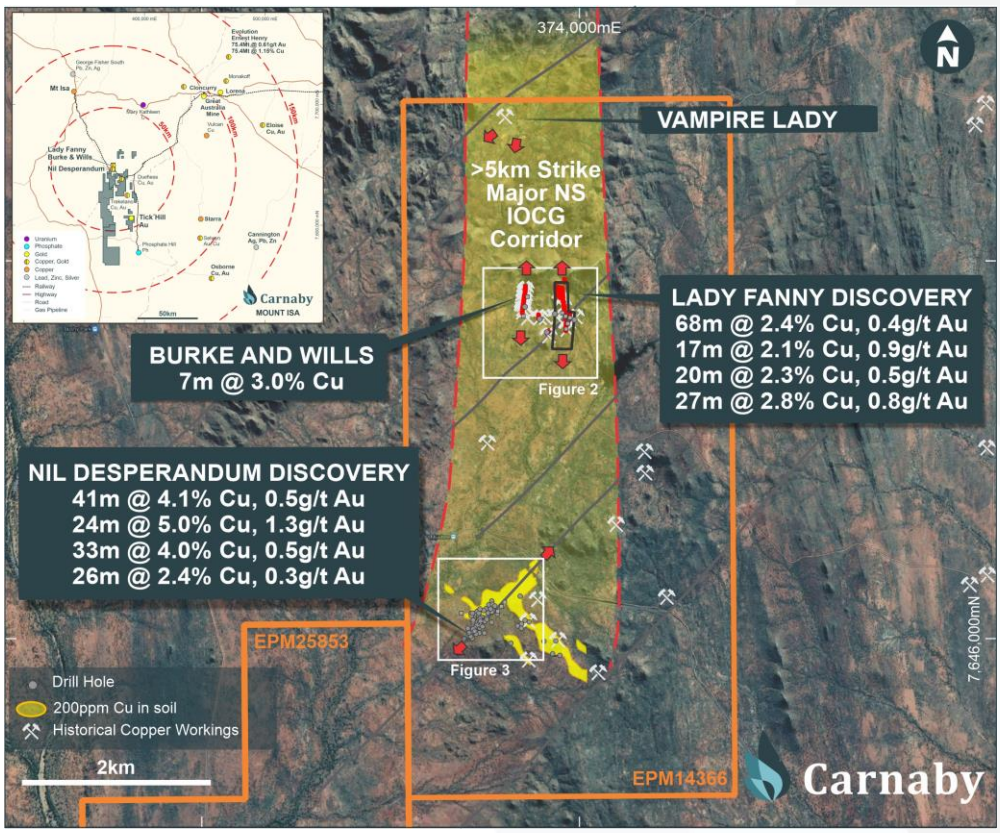

Figure 6. Location Plan of Lady Fanny and Nil Desperandum Discoveries.

Competent Person Statement

The information in this document that relates to exploration results is based upon information compiled by Mr Robert Watkins. Mr Watkins is a Director of the Company and a Member of the AUSIMM. Mr Watkins consents to the inclusion in the report of the matters based upon the information in the form and context in which it appears. Mr Watkins has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which is undertaken to qualify as a Competent Person as defined in the December 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (JORC Code).

Disclaimer

References may have been made in this announcement to certain ASX announcements, including references regarding exploration results, mineral resources and ore reserves. For full details, refer to said announcement on said date. The Company is not aware of any new information or data that materially affects this information. Other than as specified in this announcement and the mentioned announcements, the Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and, in the case of estimates of Mineral Resources, Exploration Target(s) or Ore Reserves that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.

Table 2. Visual Estimates and Description of Sulphide Mineralisation.

In relation to the disclosure of visual mineralisation, the Company cautions that estimates of sulphide mineral abundance from preliminary geological logging should not be considered a proxy for quantitative analysis of a laboratory assay result. Assay results are required to determine the actual widths and grade of the visible mineralisation.

APPENDIX TWO

JORC Code, 2012 Edition | 'Table 1' Report

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. • Include reference to measures taken to ensure sample representivity and the	• Visually estimated sulphide abundance are presented in Appendix 1. • The RC drill chips were logged and visual abundances estimated by suitably qualified and experienced geologist. • Sampling from diamond core was from selected geological intervals of varying length, mostly 1m within the mineralisation. Core was half core sampled within the mineralised zones and quarter core sampled over 2m intervals in the non-mineralised intervals.

Criteria	JORC Code explanation	Commentary
	appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralisation that are Material to the Public Report. • In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	• Recent RC samples were collected via a cone splitter mounted below the cyclone. A 2-3kg sample was collected from each 1m interval.
Drilling techniques	• Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	• All recent RC holes were completed using a 5.5'' face sampling bit. • Diamond drilling was completed using NQ sized core after re-entering a 300m deep RC pre-collar.
Drill sample recovery	• Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	• For recent RC drilling, no significant recovery issues for samples were observed. • Drill chips collected in chip trays are considered a reasonable visual representation of the entire sample interval. • No significant core loss was observed from the recent diamond holes.
Logging	• Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged.	• RC holes have been logged for lithology, weathering, mineralisation, veining, structure and alteration. • Diamond core holes logged for lithology, weathering, mineralisation, veining, structure, alteration and RQD. Holes less than 85 degrees dip were orientated and measurements of the structures and mineralisation taken. • All chips have been stored in chip trays on 1m intervals and logged in the field.
Sub-sampling techniques and sample preparation	• If core, whether cut or sawn and whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled.	• All RC samples are cone split at the cyclone to create a 1m sample of 2-3kg. The remaining sample is retained in a plastic bag at the drill site. • For mineralised zones, the 1m cone split sample is taken for analysis. For non-mineralised zones a 5m composite spear sample is collected and the individual 1m cone split samples over the same interval retained for later analysis if positive results are returned. • Core samples are half sawn on one side of the orientation line and core consistently samples on one side. Mineralised core is generally sampled on 1m or less intervals. Where sampled, non-mineralised core is quarter cut and sampled on 2m intervals.

Criteria	JORC Code explanation	Commentary
Quality of assay data and laboratory tests	• The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	• Company inserted blanks are inserted as the first sample for every hole. A company inserted gold standard and a copper standard are inserted every 50th sample. No standard identification numbers are provided to the lab. • Standards are checked against expected values to ensure they are within tolerance. No issues have been identified.
Verification of sampling and assaying	• The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data.	• Historic production data has been collated from government open file reports. • A Maxgeo SQL database is currently used in house for all historic and new records. Recent results have been reported directly from lab reports and sample sheets collated in excel. • Results reported below the detection limit have been stored in the database at half the detection limit – eg <0.001ppm stored as 0.0005ppm
Location of data points	• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control.	• All hole locations were obtained using a Trimble SP60 GPS in UTM MGA94. Current RC holes were downhole surveyed by Reflex True North seeking gyro.
Data spacing and distribution	• Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied.	• Further extensional and infill drilling is required to confirm the orientation and true width of the copper mineralisation intersected.
Orientation of data in relation to geological structure	• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	• All holes were considered to intersect the mineralisation at a reasonable angle.
Sample security	• The measures taken to ensure sample security.	• Recent RC drilling has had all samples immediately taken following drilling and submitted for assay by supervising Carnaby geology personnel.
Audits or reviews	• The results of any audits or reviews of sampling techniques and data.	• Not conducted

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section).

Criteria	Explanation	Commentary
Mineral tenement and land tenure status	• Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. • The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	• The Lady Fanny Prospect area encompassed by historical expired mining leases have been amalgamated into EPM14366 and is 100% owned by Carnaby. • The Nil Desperandum Prospect is located on EPM14366 (82.5% interest acquired from Discovex). • Discovex retain a 17.5% free carried interest in the project through to a Decision To Mine. • At a Decision to Mine, Carnaby has the first right of refusal to acquire the remaining interest for fair market value.
Acknowledgment and appraisal of exploration by other parties.	• Acknowledgment and appraisal of exploration by other parties.	• There has been exploration work conducted over the Queensland project regions for over a century by previous explorers. The project comes with significant geoscientific information which covers the tenements and general region, including: a compiled database of 6658 drill hole (exploration and near-mine), 60,300 drilling assays and over 50,000 soils and stream sediment geochemistry results. This previous exploration work is understood to have been undertaken to an industry accepted standard and will be assessed in further detail as the projects are developed.
Geology	• Deposit type, geological setting and style of mineralisation.	• The Nil Desperandum and Lady Fanny prospects area located in the Mary Kathleen domain of the eastern Fold Belt, Mount Isa Inlier. The Eastern Fold Belt is well known for copper, gold and copper-gold deposits; generally considered variants of IOCG deposits. The region hosts several long-lived mines and numerous historical workings. Deposits are structurally controlled, forming proximal to district-scale structures which are observable in mapped geology and geophysical images. Local controls on the distribution of mineralisation at the prospect scale can be more variable and is understood to be dependent on lithological domains present at the local-scale, and orientation with respect to structures and the stress-field during D3/D4 deformation, associated with mineralisation. • Consolidation of the ground position around the mining centres of Tick Hill and Duchess and planned structural geology analysis enables Carnaby to effectively explore the area for gold and copper-gold deposits.
Drill hole Information	• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: o easting and northing of the drill hole collar o elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar o dip and azimuth of the hole o down hole length and interception depth o hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	• Included in report Refer to Appendix 1, Table 1.

Criteria	Explanation	Commentary
Data aggregation methods	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated.	• Visual estimates given in Appendix 1, Table 2 represent the intervals as sampled and to be assayed. • No metal equivalent values have been reported
Relationship between mineralisation widths and intercept lengths	• These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').	• All intervals are reported are downhole width and true widths are not definitively known. At Lady Fanny and Nil Desperandum drilling intersection angles are generally good and are a good representation of the thickness of the mineralised zones. At Nil Desperandum true thickness is generally about 70% of downhole width.
Diagrams	• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	• See the body of the announcement.
Balanced reporting	• Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	• Visual estimates of copper sulphides by individual meters are presented in Appendix 1, Table 2
Other substantive exploration data	• Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	• As discussed in the announcement
Further work	• The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). • Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	• Planned exploration works are detailed in the announcement.
