

**ASX CODE: MTB** 

10 June 2021

# Kihabe Polymetallic Zn/Pb/Ag/V/Cu/Ge Deposit, Silver Domains, Botswana

Further to the announcements released to the market on 25 August 2020 and 23 February 2021, the Company has received a number of queries relative to the two silver domains in the polymetallic Zn/Pb/Ag/V/Cu/Ge Kihabe Deposit, over which the Company has title in Botswana.

The Company has been questioned as to what other minerals, if any, are associated with the two silver domains.

# Associated Mineralisation in the Kihabe Deposit Silver Domains

Whilst not specifically related to the two silver domains, associated mineralisation within the two silver domains has previously been disclosed to the market in announcements relative to:

- Zinc, Lead and Silver intersections shown separately, as well as shown as a Zinc equivalent grade
- Vanadium and Vanadium Pentoxide mineralisation
- Copper mineralisation

However, for clarification, the Company has now engaged in compiling data to specifically show what other mineralisation is associated with the silver in the two domains.

# The Kihabe Deposit Silver Domains

Within the overall 2.4km strike length of the Kihabe Deposit, there is a SW silver domain and a NE silver domain (Refer to Figure 1).

The SW domain covers a strike length of 550m extending from local grid co-ordinates 9,850E to 10,400E. The NW domain covers a strike length of 500m extending from local grid co-ordinates 11,500E to 12,000E

To date the Company has only completed compiling data specifically relative to mineralisation associated with Silver in the SW domain (Refer to Table 1 and Figures 1 to 33)

The average grades of Ag, Zn, Pb, Cu and  $V_2O_5$  mineralisation for each of the 14 drill hole sections are shown in the summary following Table 1. Not all holes were assayed for V and only seven holes were assayed for Ge. All assaying of future drilling will include Vanadium and Germanium.

Data relative to the NE silver domain will be released to the market once it has been compiled.

TABLE 1 KIHABE SILVER GRADES SECTION 9,850E TO SECTION 10,400E

# Summary of Average Grades of Sections within the Kihabe SW Silver Domain

#### **SECTION 9850E**

#### SECTION 9,900E

Average Ag grade over 52m of mineralisation = 28.4g/t

Average Zn grade over 384m of mineralisation = 2.3%

Average Pb grade over 94m of mineralisation =1.7%

# SECTION 9,950E

Average Ag grade over 15m of mineralisation = 16.1g/t

Average Zn grade over 60m of mineralisation = 2.8%

Average Pb grade over 54m of mineralisation = 1.9%

Average Cu grade over 4m of mineralisation = 0.2%

### **SECTION 10,000E**

Average Ag grade over 119m of mineralisation = 39.2g/t (1.3oz/t)

Average Zn grade over 191m of mineralisation = 2.3%

Average Pb grade over 94m of mineralisation = 1.9%

Average V2O5 grade over 51m of mineralisation = 921ppm

#### **SECTION 10,025E**

Average Zn grade over 30m of mineralisation = 1.8%

Average Pb grade over 16m of mineralisation = 1.7%

Average V2O5 grade over 22m of mineralisation = 798ppm

#### **SECTION 10,050E**

Average Ag grade over 165m of mineralisation = 75.5g/t (2.4oz/t)

Average Zn grade over 165m of mineralisation = 2.3%

Average Pb grade over 129m of mineralisation = 1.7%

#### **SECTION 10,075E**

Average Ag grade over 34m of mineralisation = 56.9g/t (1.8oz/t)

Average Zn grade ovger23m of mineralisation = 1.9%

Average Pb grade over 21m of mineralisation = 1.5%

Average V2O5 grade over 17m of mineralisation = 1,309ppm

## **SECTION 10,100E**

Average Ag grade over 121m of mineralisation = 68.6g/t (2.20oz/t)

Average Zn grade over 174m of mineralisation = 4.6%

Average Pb grade over 135m of mineralisation =2.0%

Average Cu grade over 1m of mineralisation = 1.0%

Average V2O5 grade over 102m of mineralisation = 1,310ppm

### **SECTION 10,125E**

Average Ag grade over 3m of mineralisation = 10.8g/t

Average Zn grade over 3m of mineralisation = 1.3%

Average Pb grade over 2m of mineralisation = 1.2%

Average V2O5 grade over 15m of mineralisation = 555ppm

#### **SECTION 10,150E**

Average Ag grade over 3m of mineralisation = 16.3g/t

Average Zn grade over 18m of mineralisation = 3.0%

Average Pb grade over 20m of mineralisation = 1.6%

### **SECTION 10,200E**

Average Ag grade over 11m of mineralisation = 20.2g/t

Average Zn grade over 120m of mineralisation = 2.2%

Average Pb grade over 31m of mineralisation = 1.4%

Average V2O5 grade over 9m of mineralisation = 1,022ppm

#### **SECTION 10,250E**

Average Ag grade over 1m of mineralisation = 41.4g/t (1.3oz/t)

Average Zn grade over 29m of mineralisation = 2.3%

Average Pb grade over 21m of mineralisation = 1.4%

#### **SECTION 10,300E**

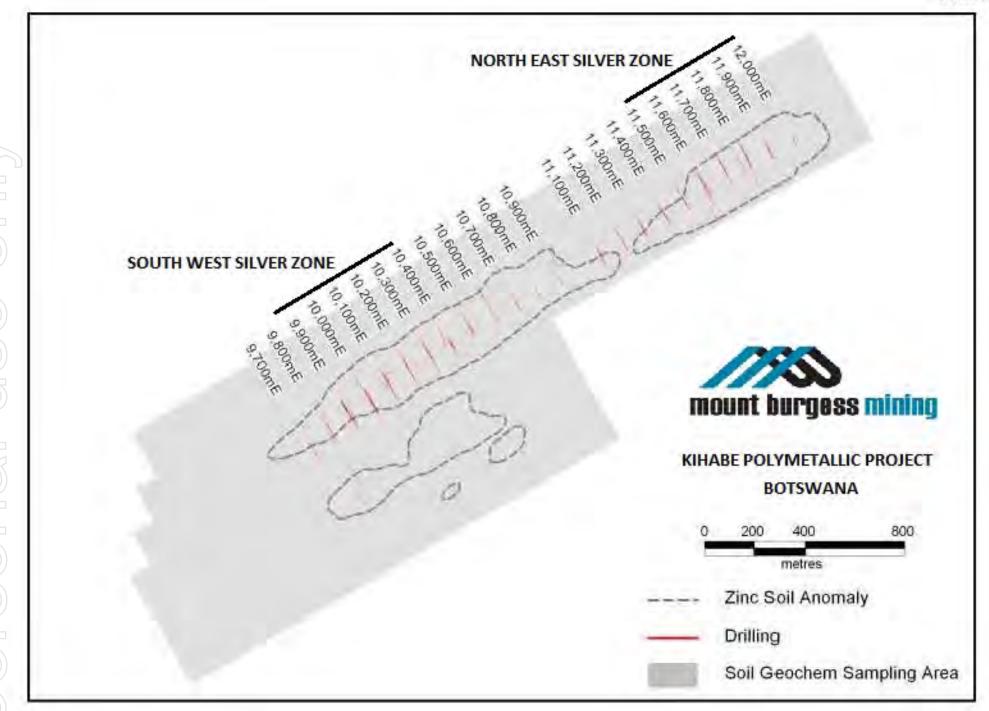

Average Ag grade over 52m of mineralisation = 26.0g/t
Average Zn grade over 127m of mineralisation = 2.6%
Average Pb grade over 55m of mineralisation = 2.0%

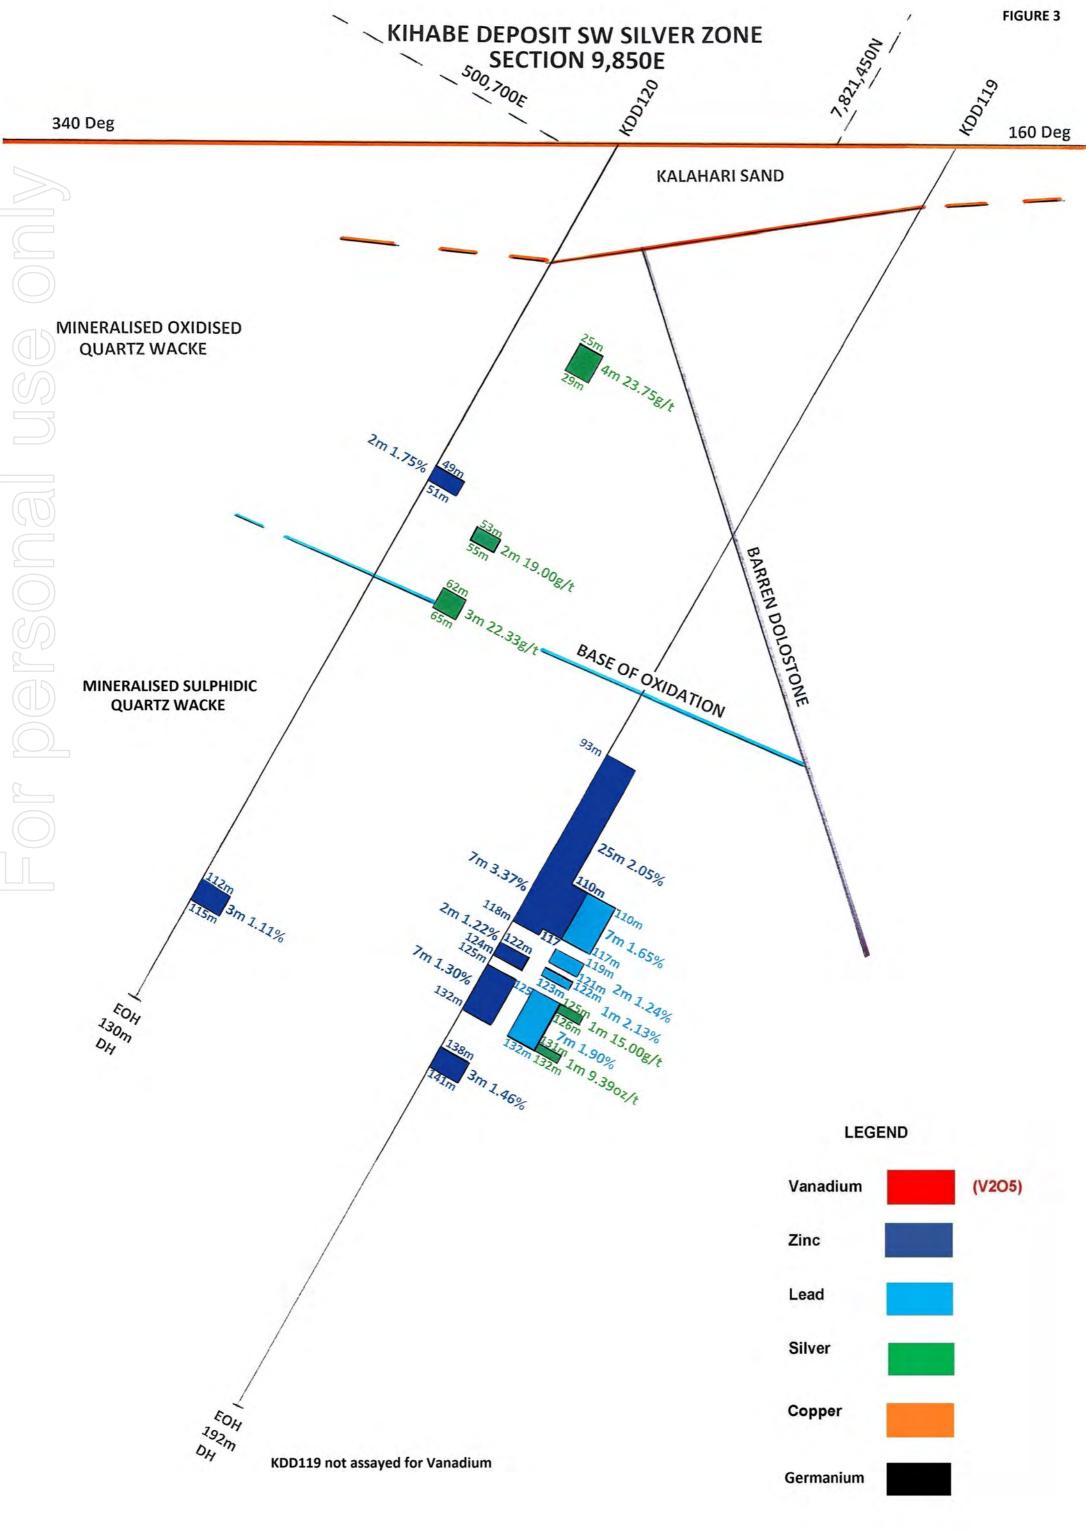

#### **SECTION 10,400E**

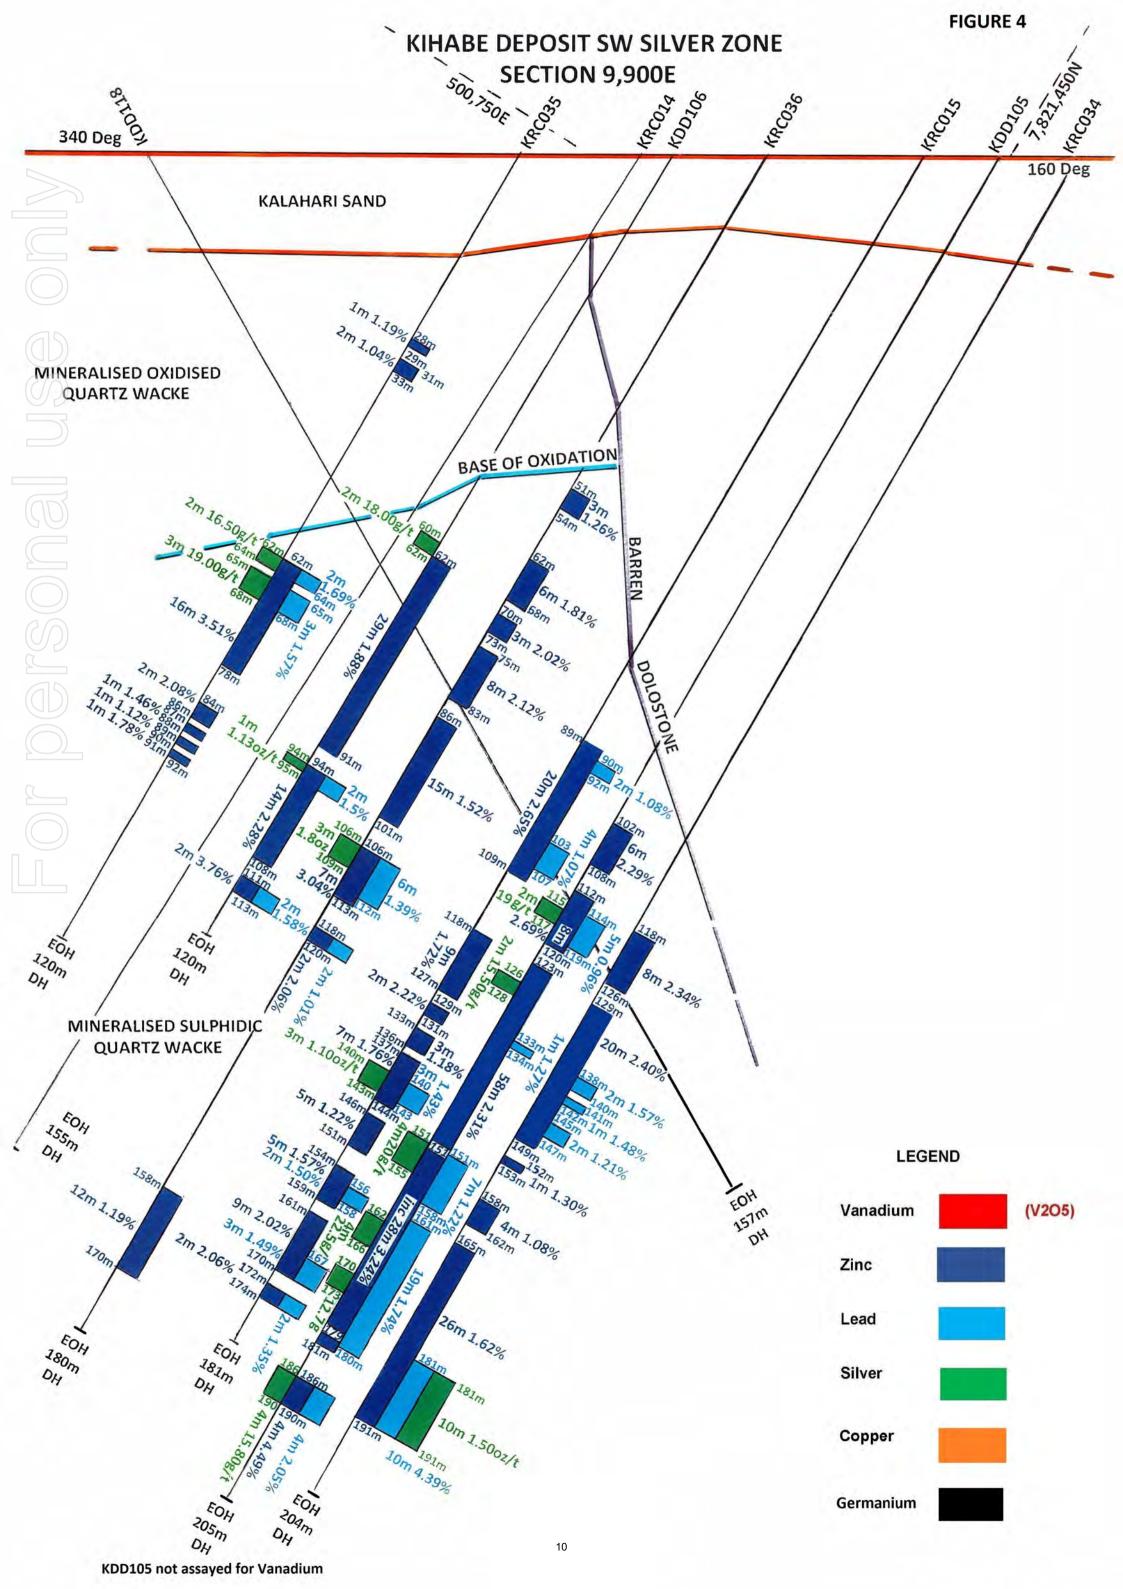

Average Ag grade over 42m of mineralisation = 18.4g/t
Average Zn grade over 242m of mineralisation = 2.4%
Average Pb grade over 108m of mineralisation = 1.2%
Average Cu grade over 17m of mineralisation = 0.2%
Average V2O5 grade over 9m of mineralisation = 744ppm

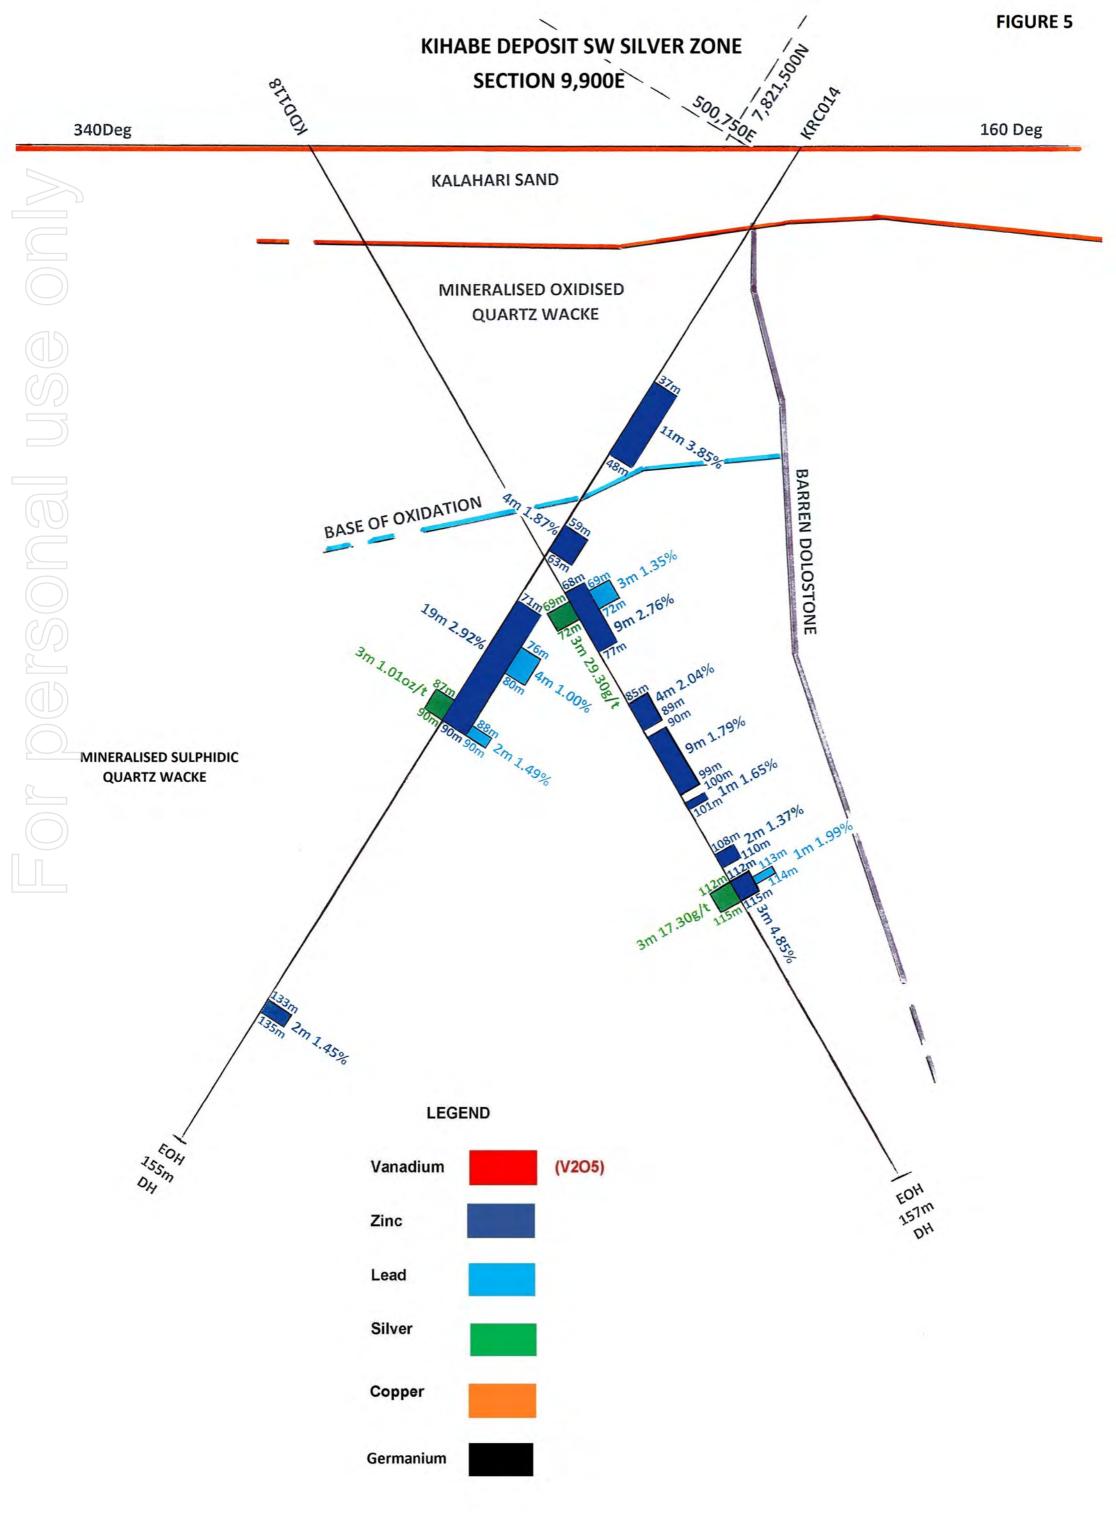

#### OVERALL AVERAGE GRADES FOR ALL SECTIONS IN THE KIHABE SW SILVER DOMAIN

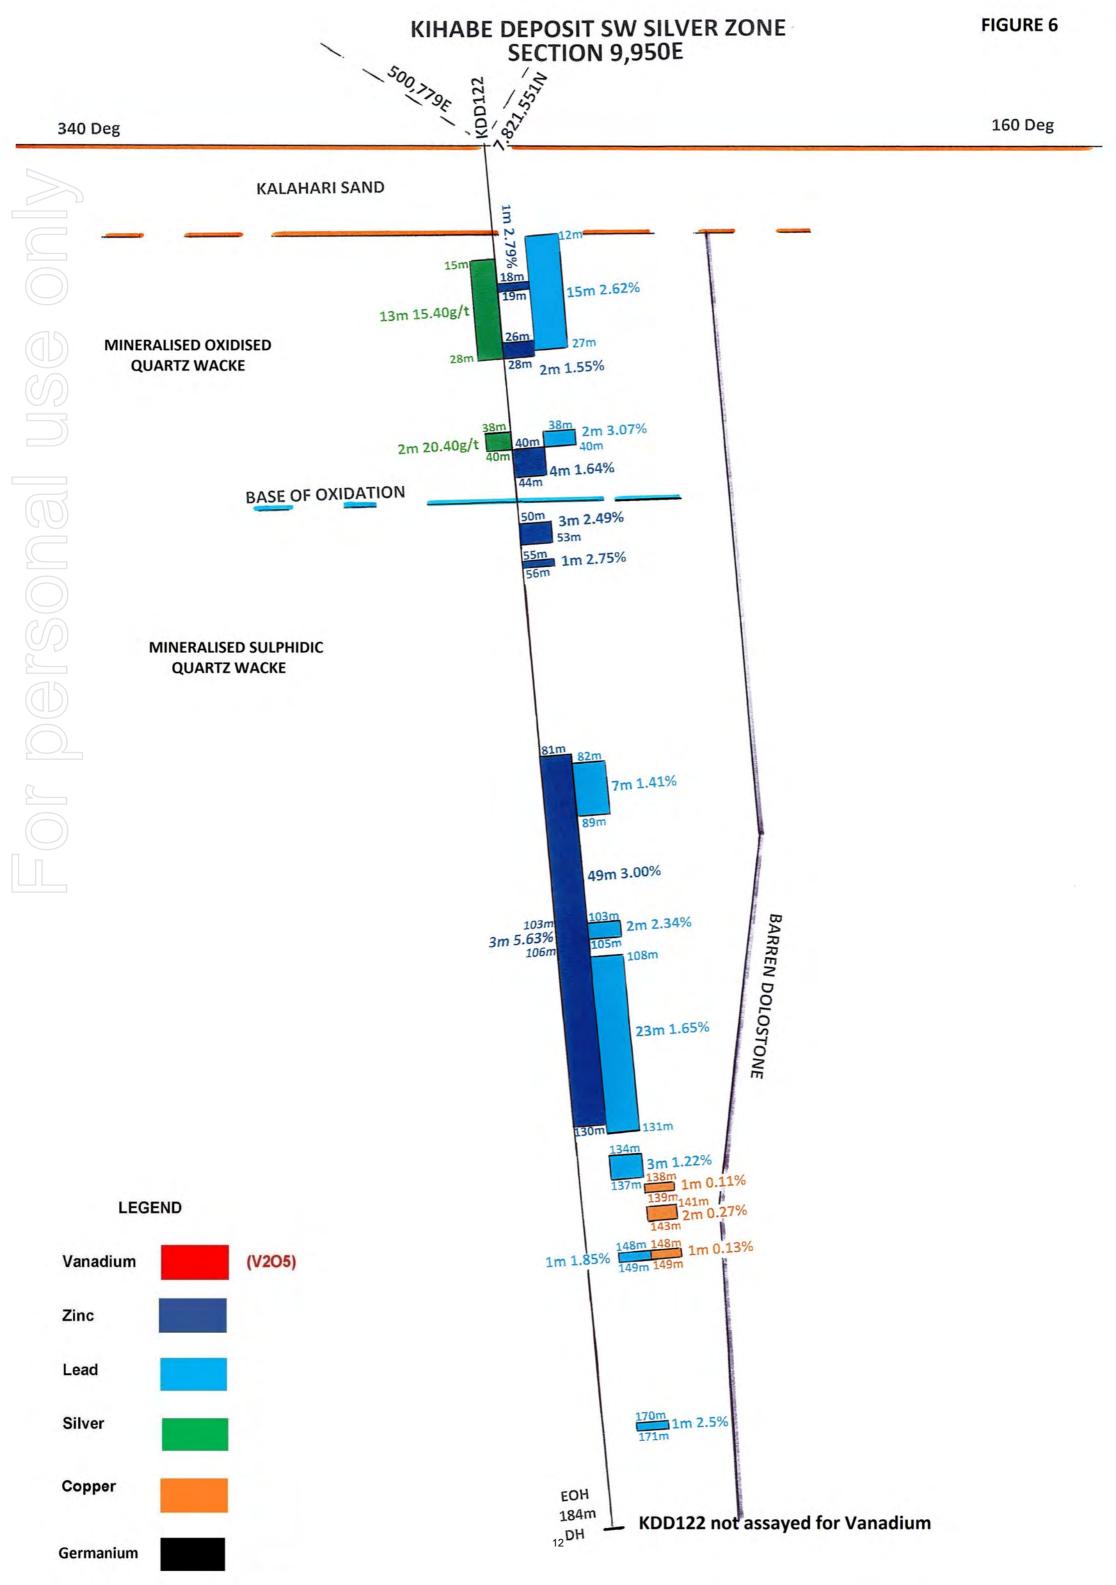

Average Ag grade over 657m of mineralisation = 49.7g/t (1.6oz/t)
Average Zn grade over 1,611m of mineralisation = 2.6%
Average Pb grade over 799m of mineralisation = 1.7%
Average Cu grade over 22m of mineralisation = 0.2%
Average V2O5 grade over 240m of mineralisation = 1,053ppm

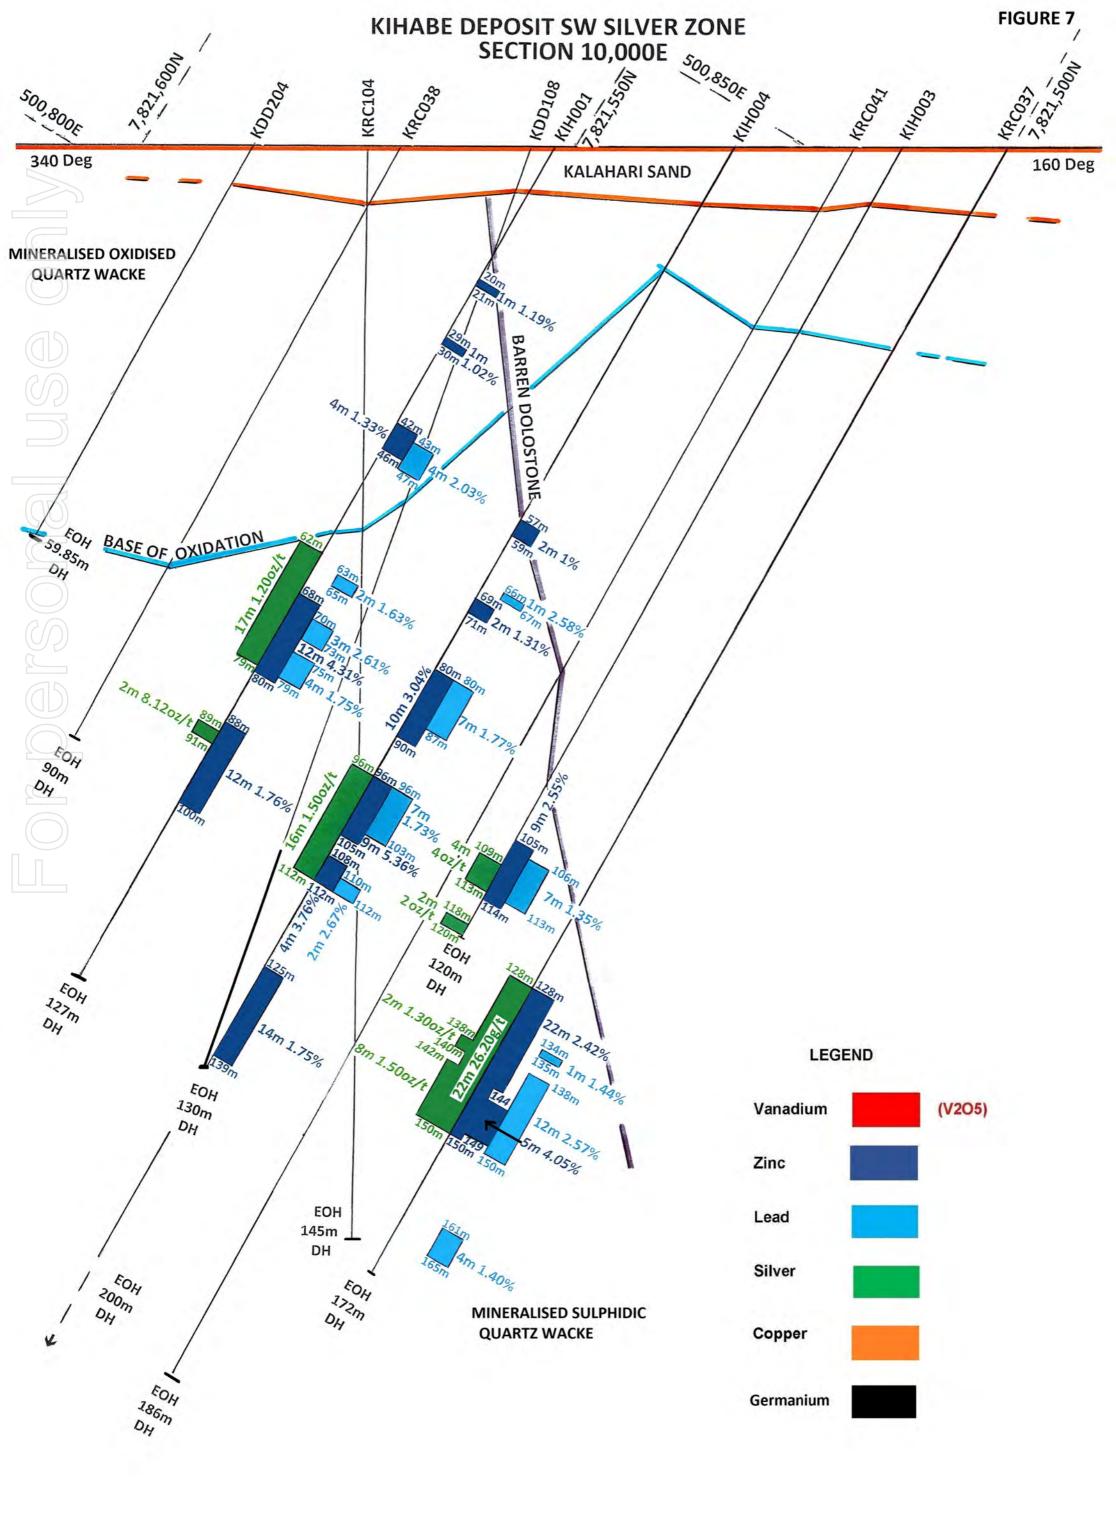

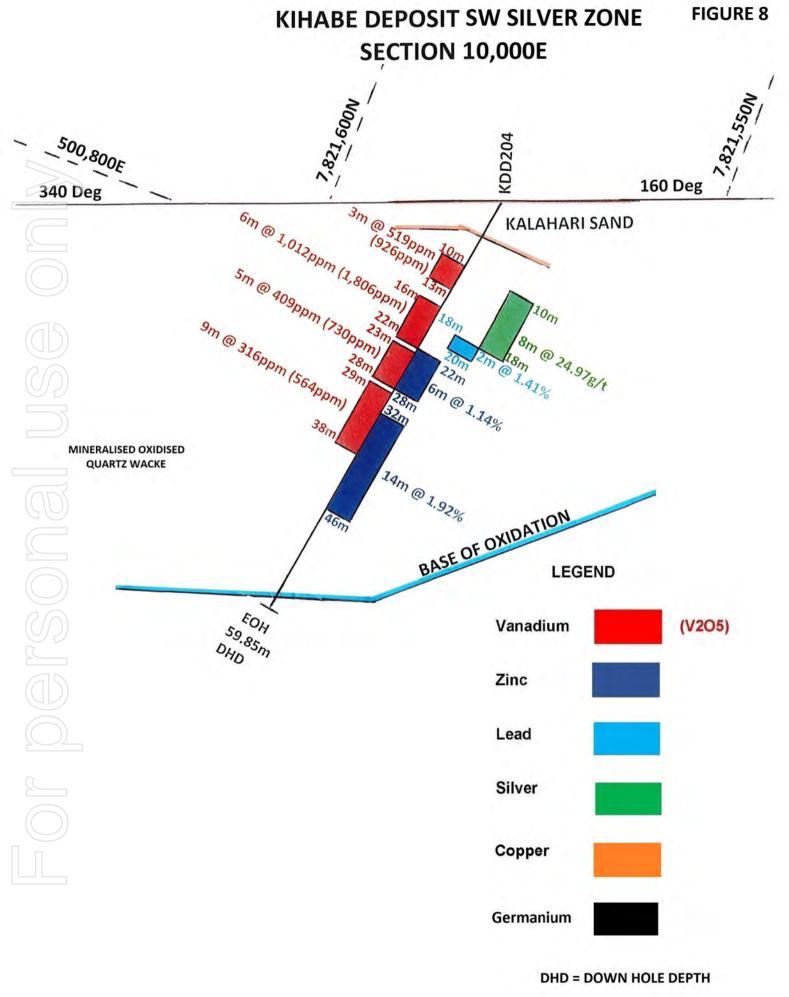

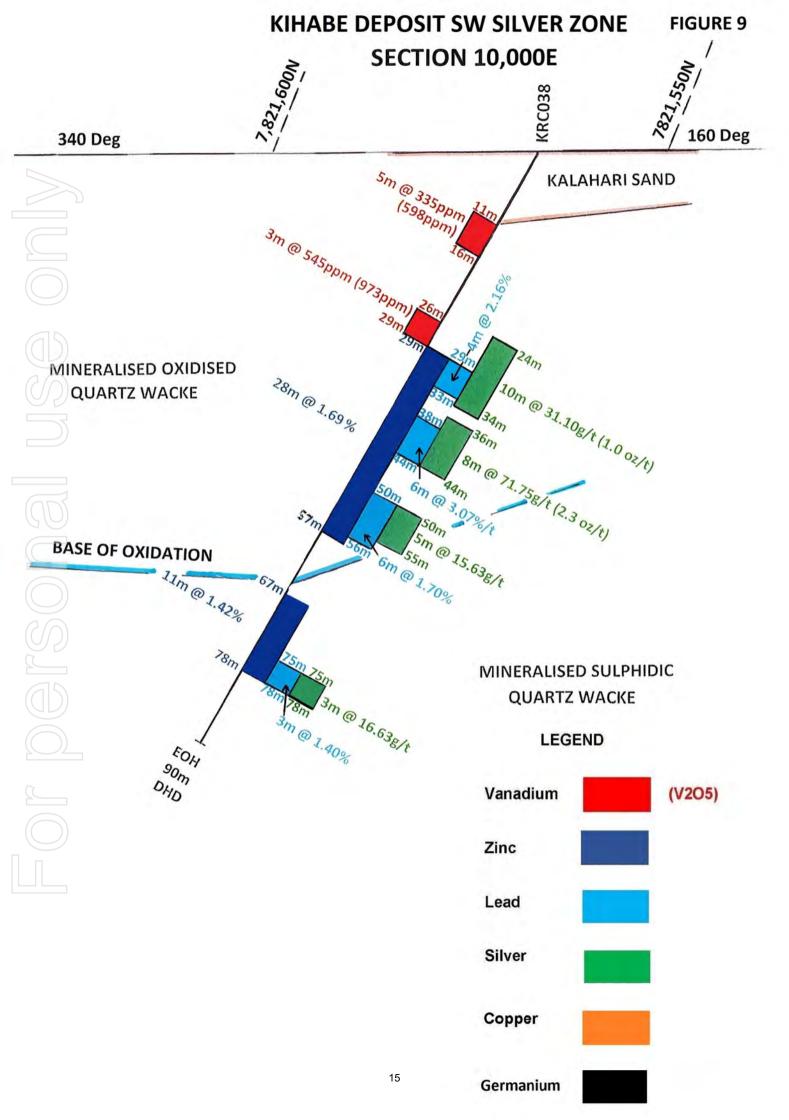

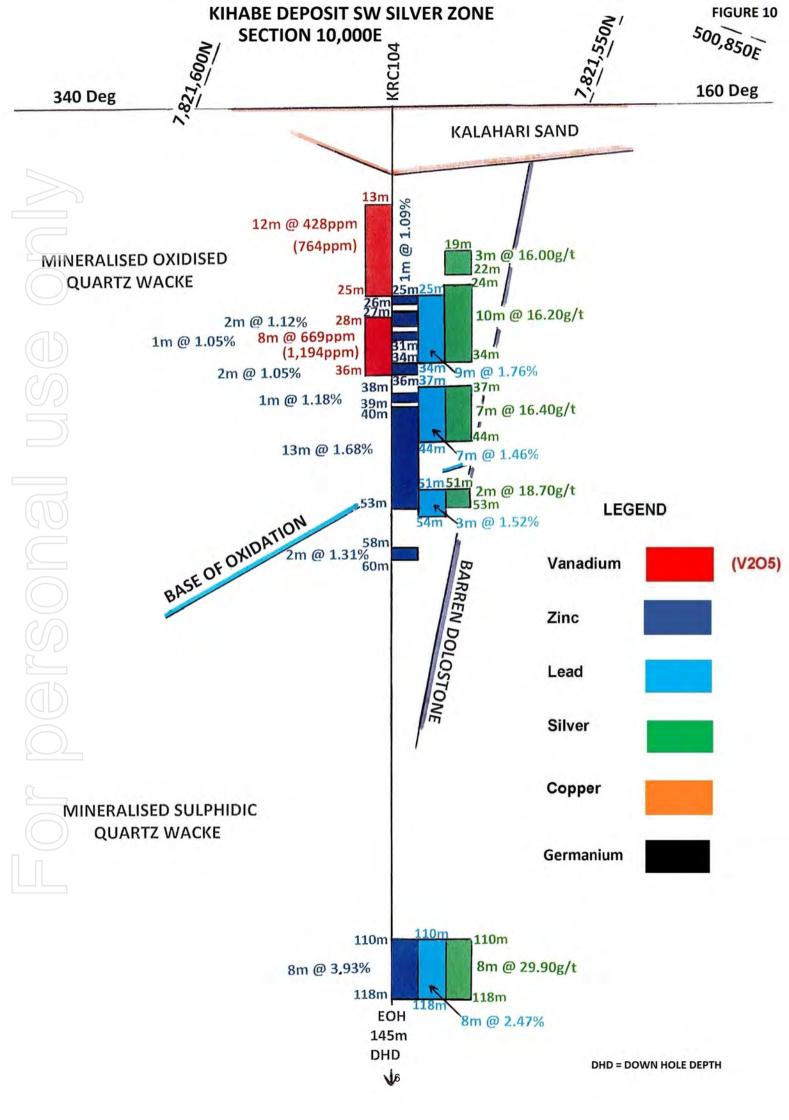

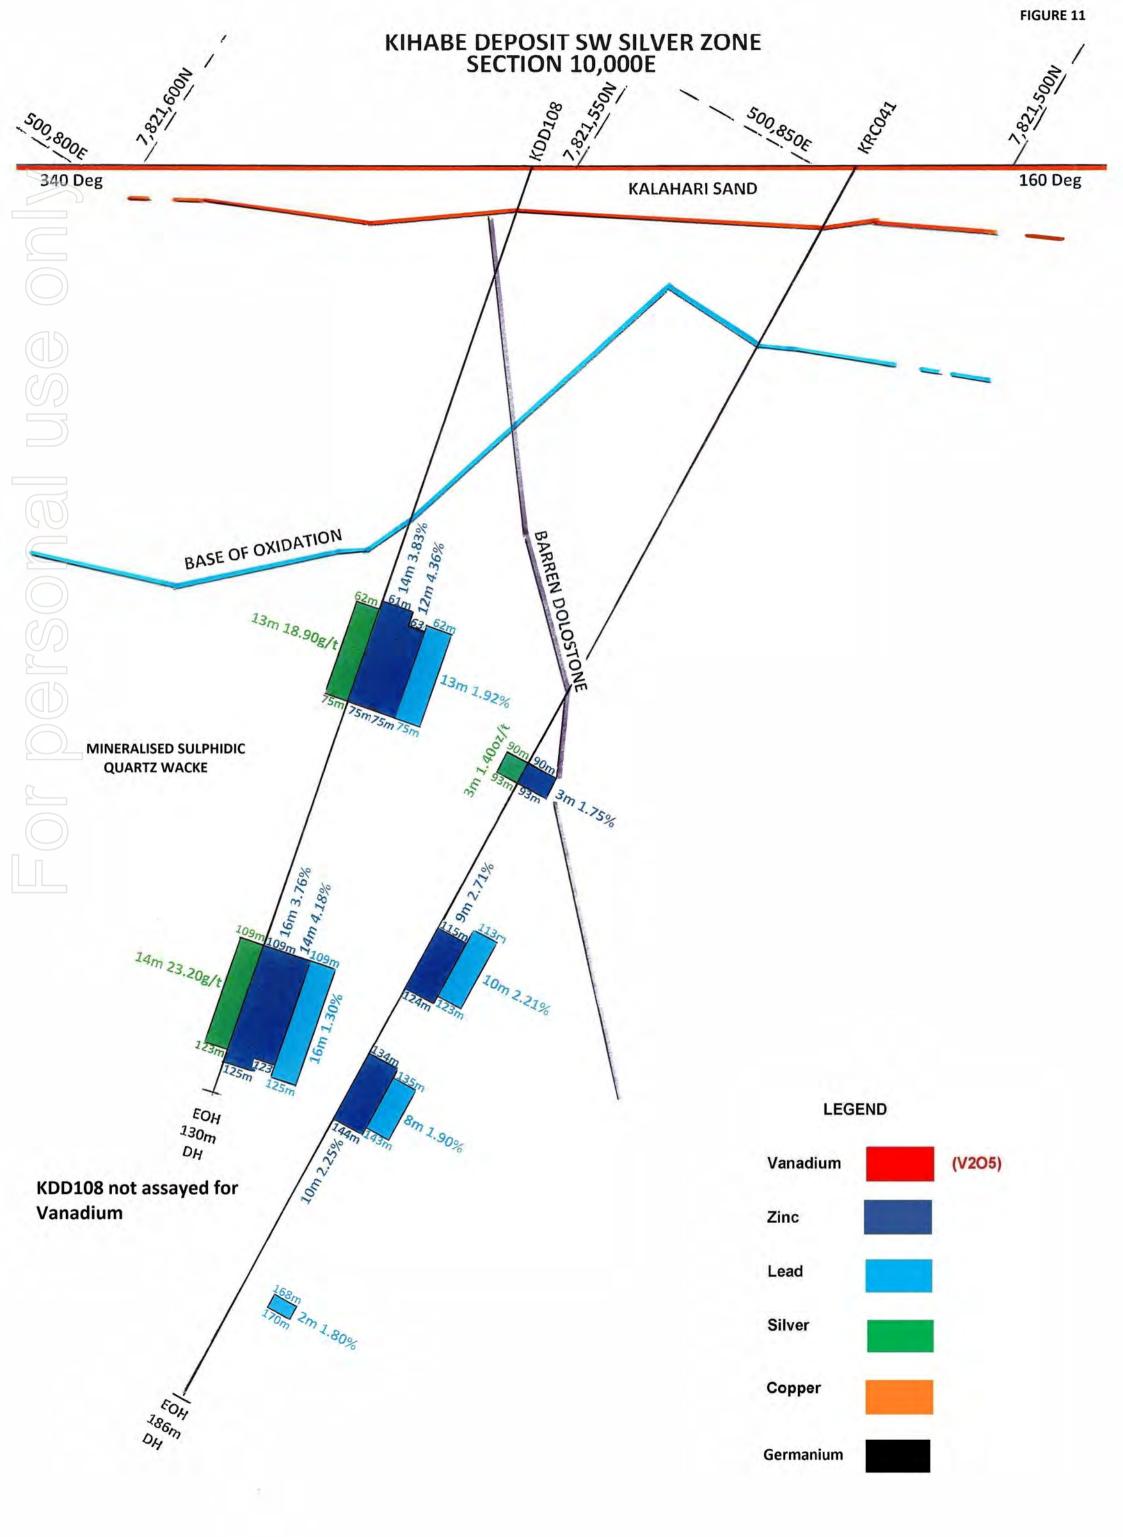

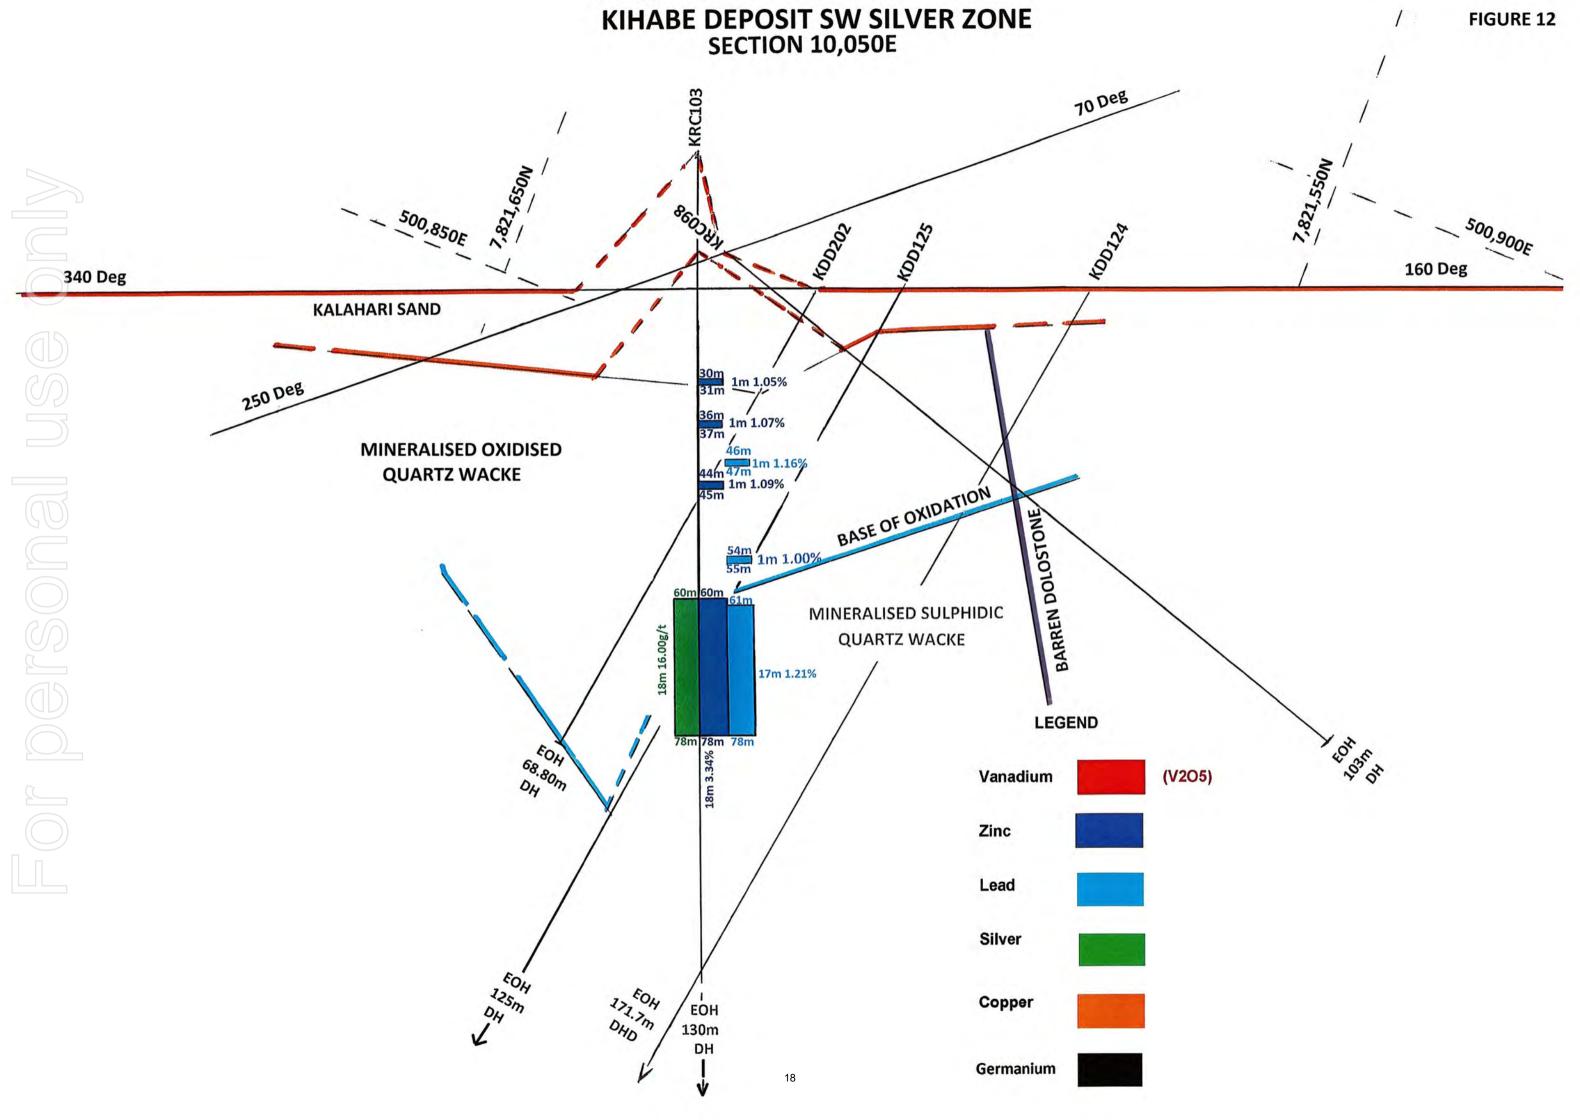

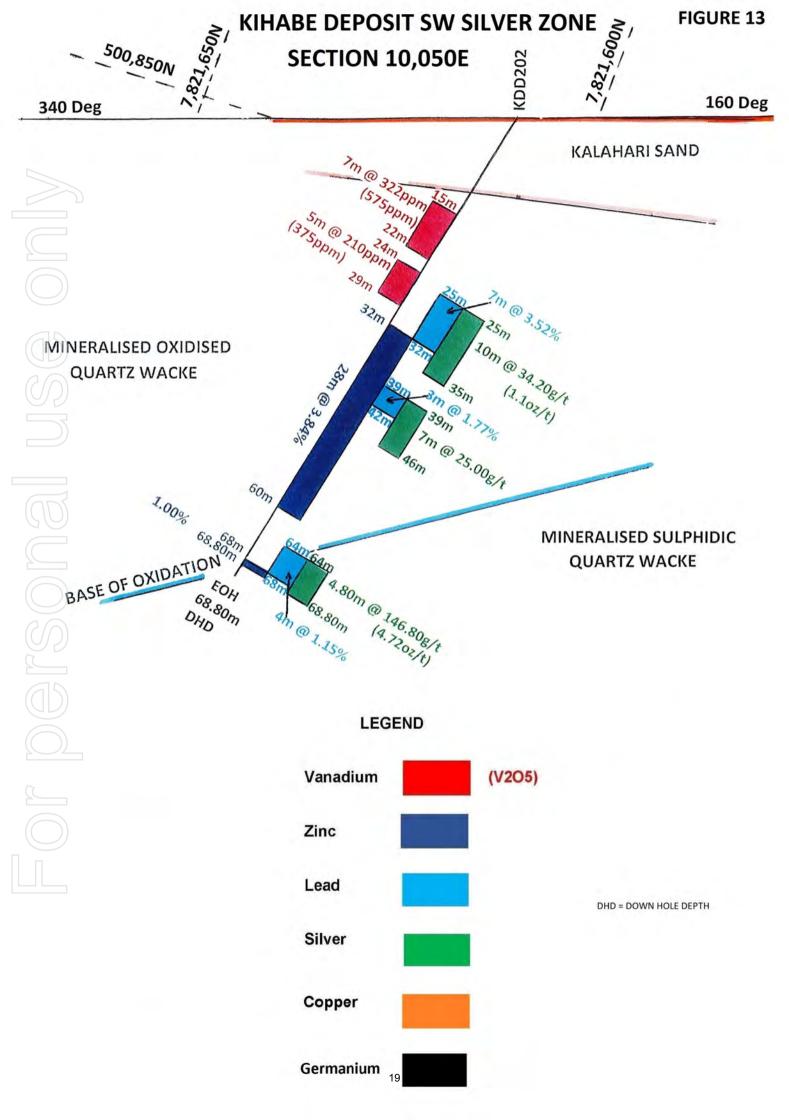

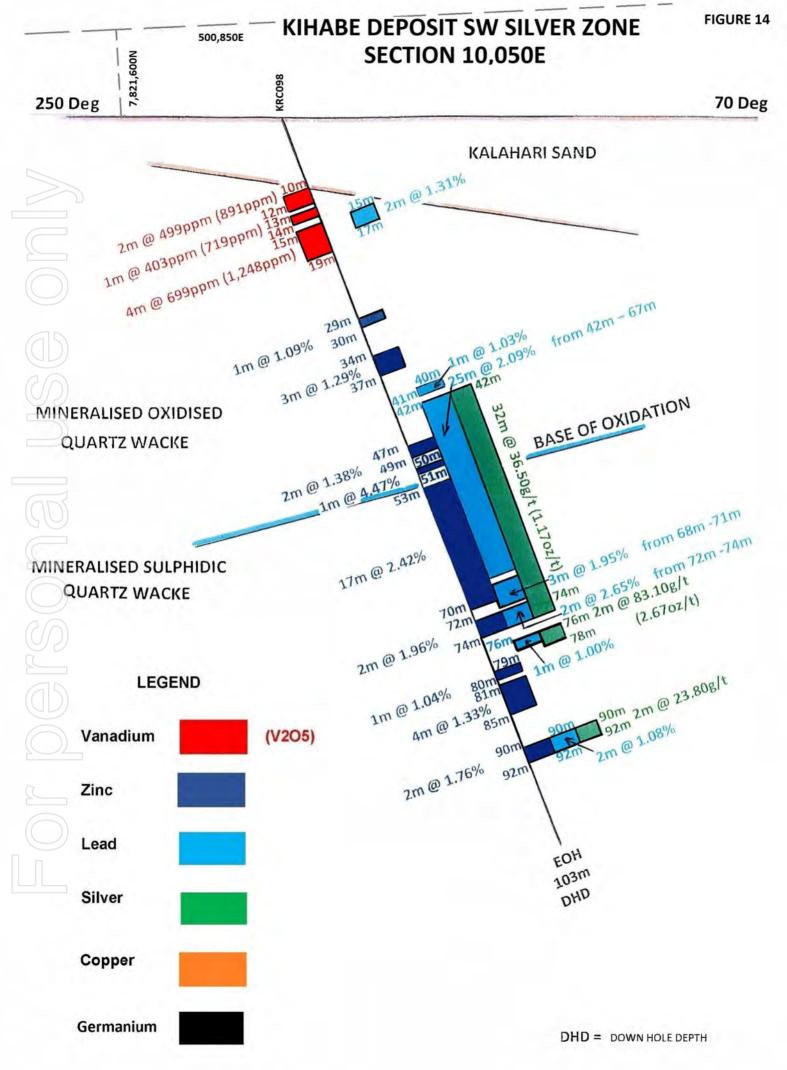

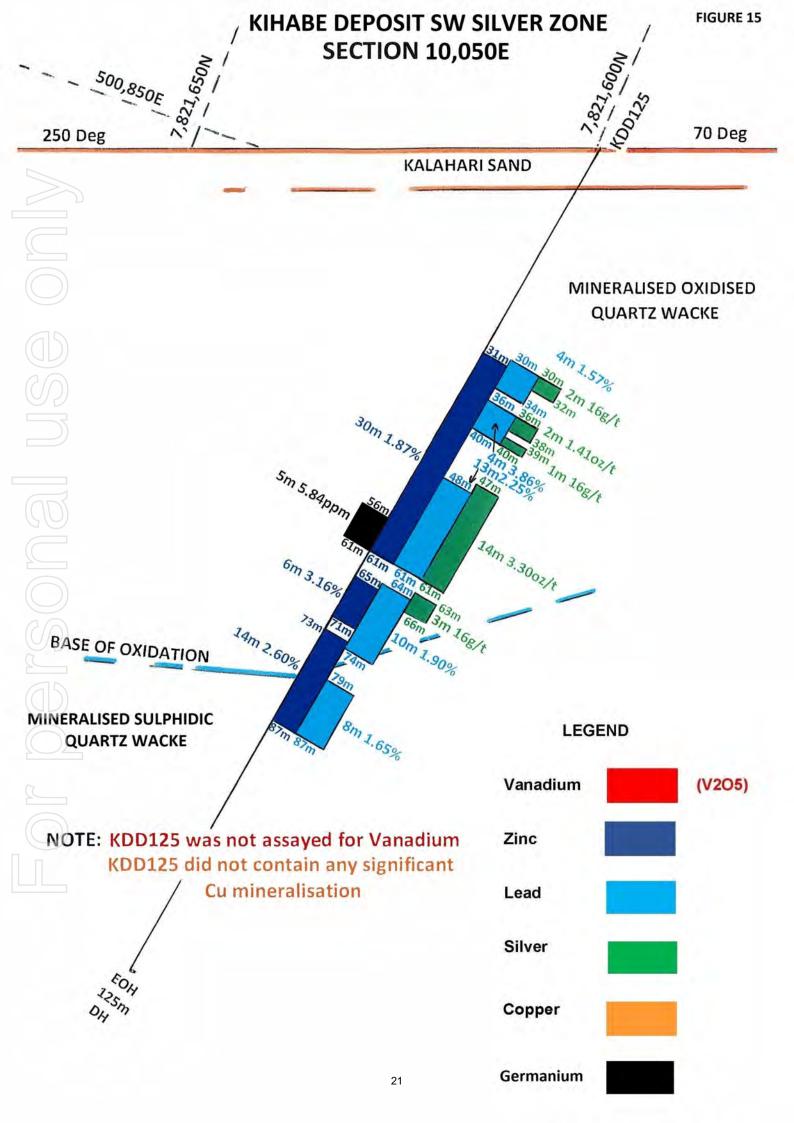

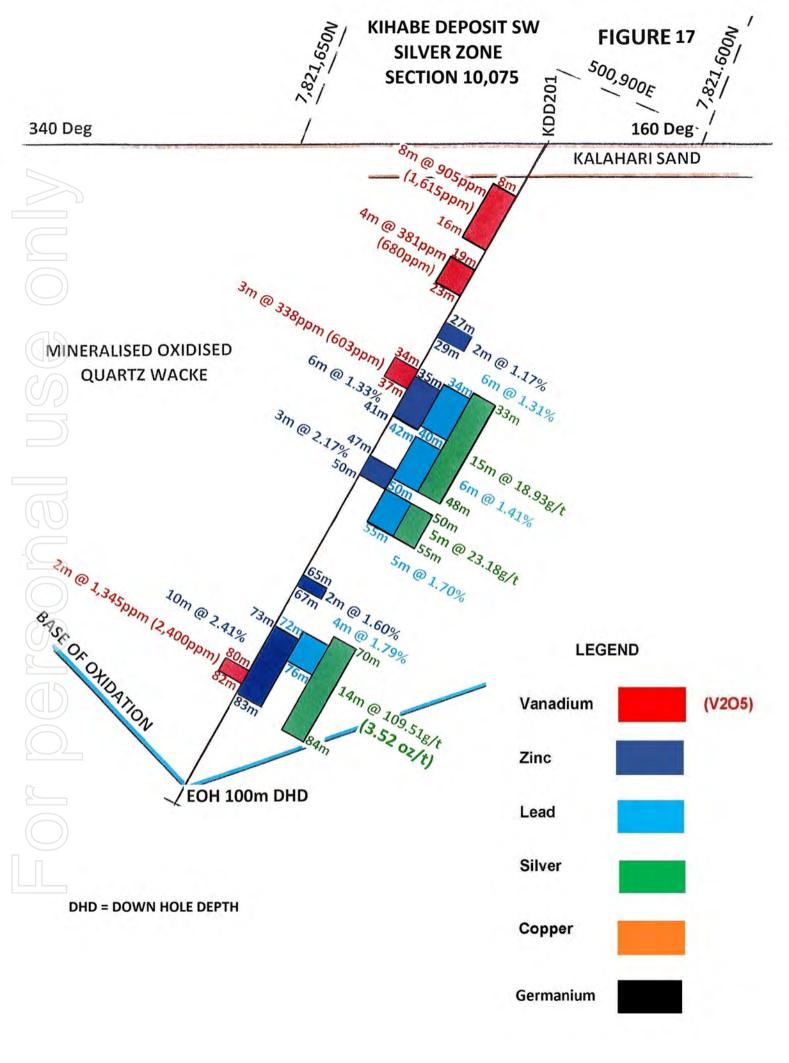

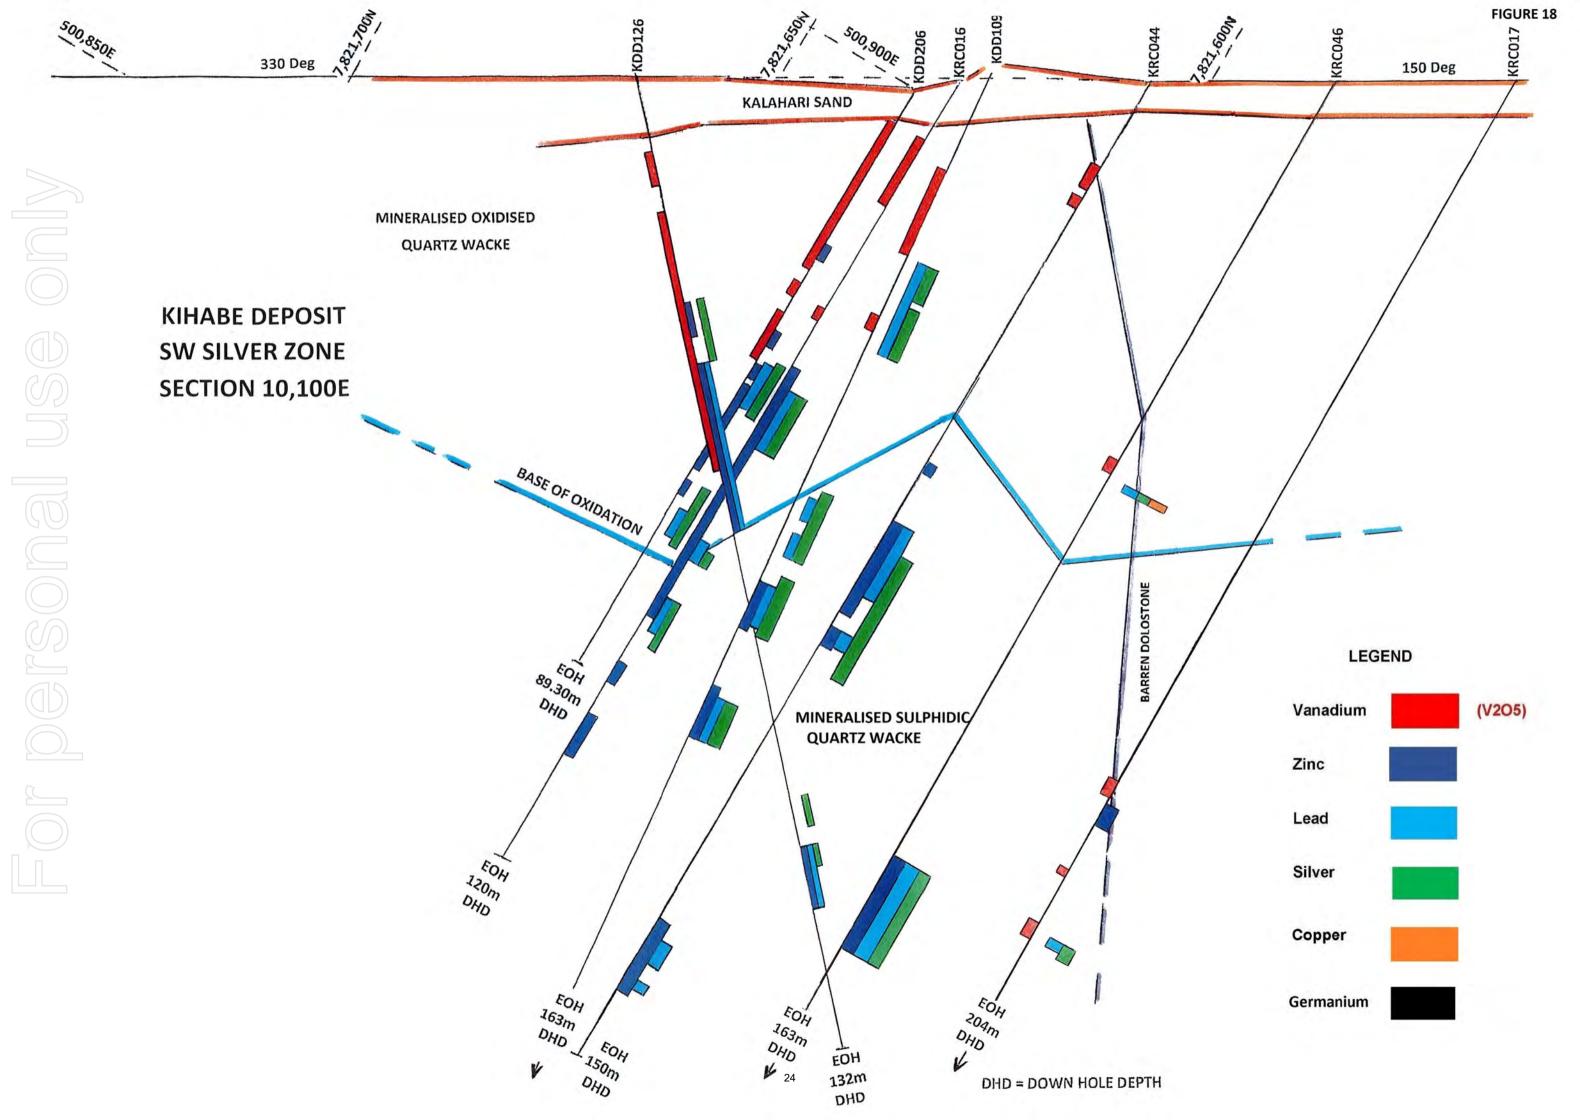

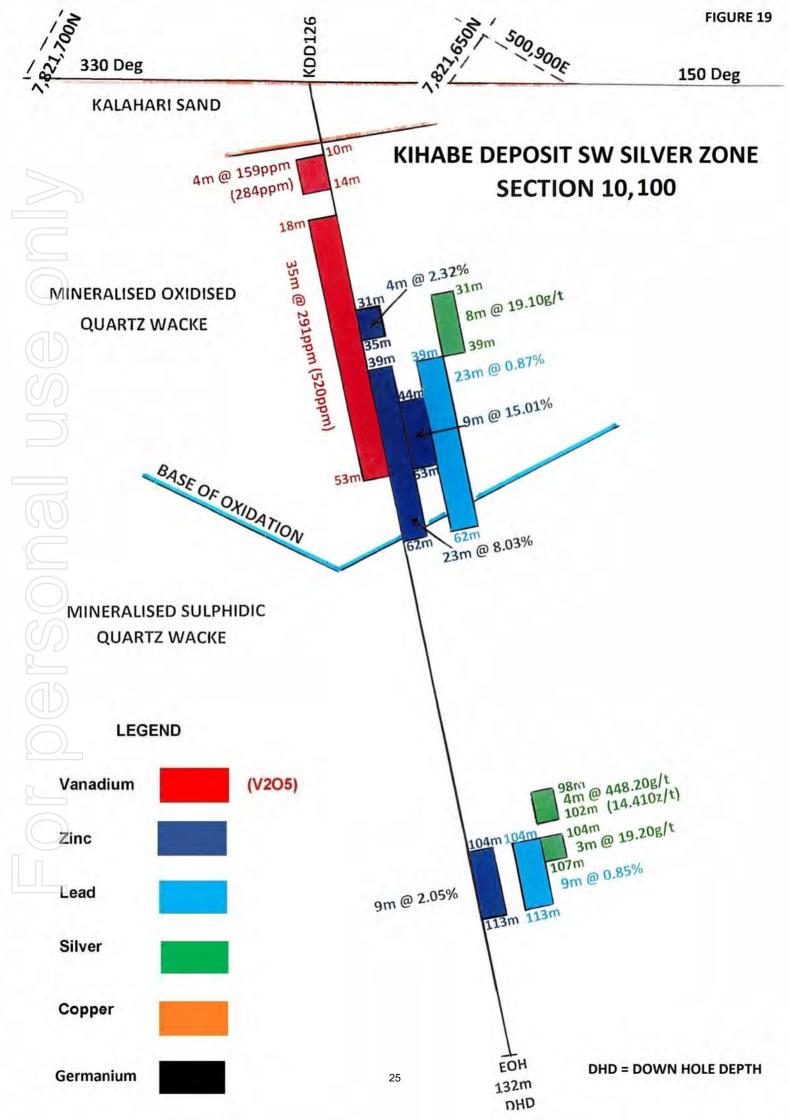

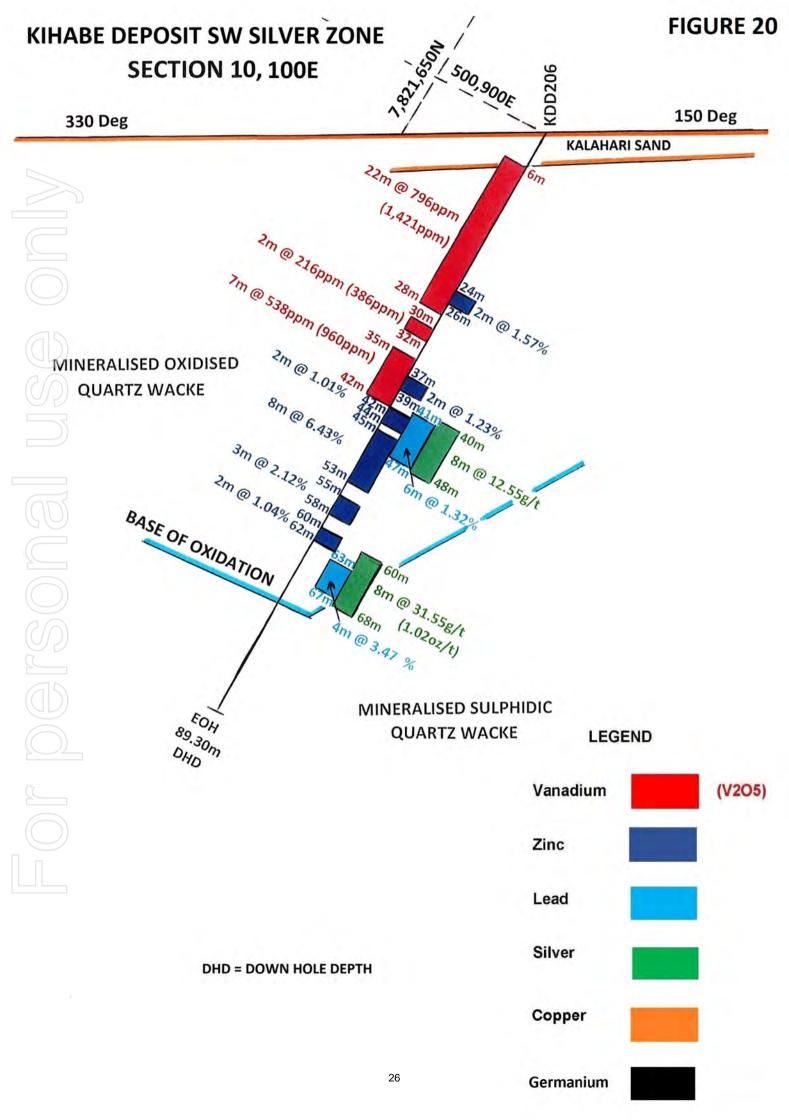

DHD = DOWN HOLE DEPTH

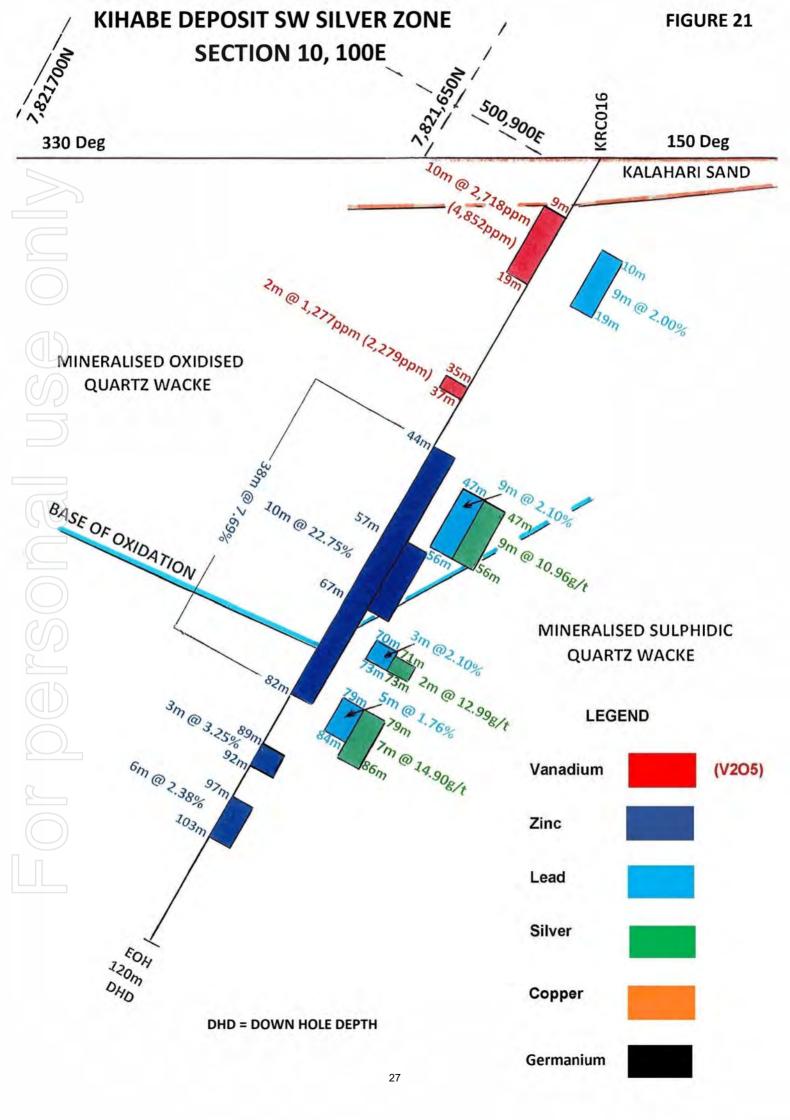

Germanium

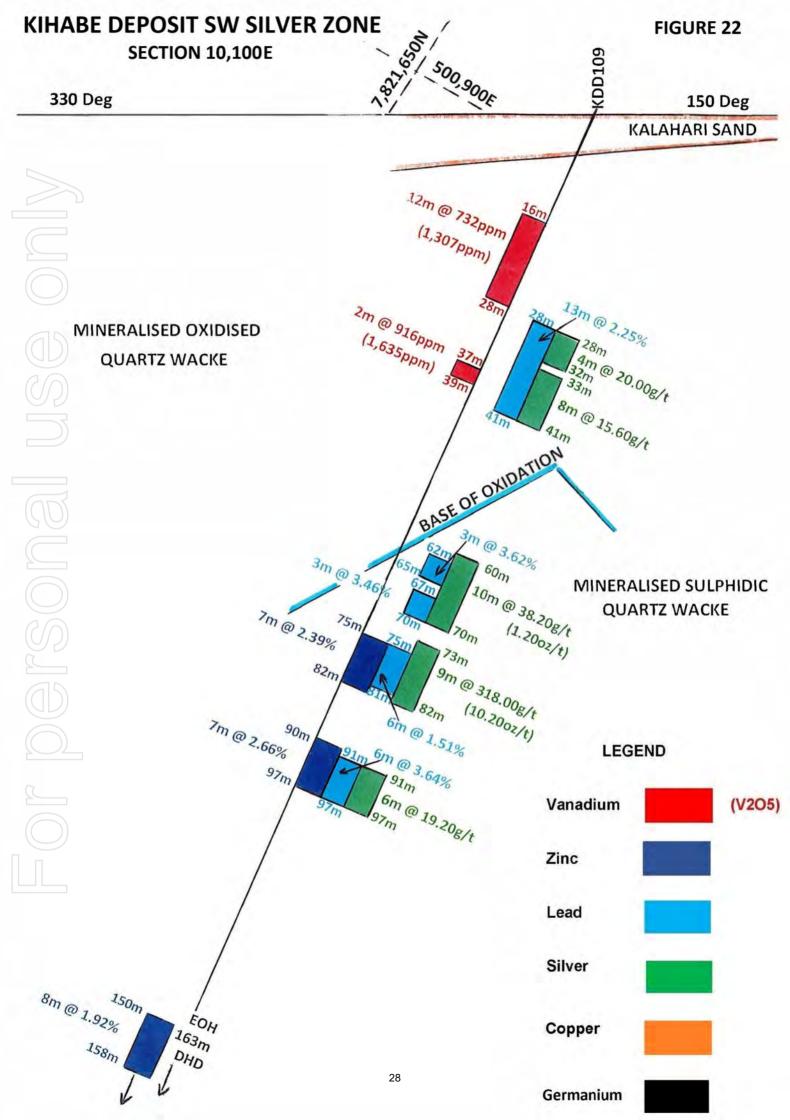

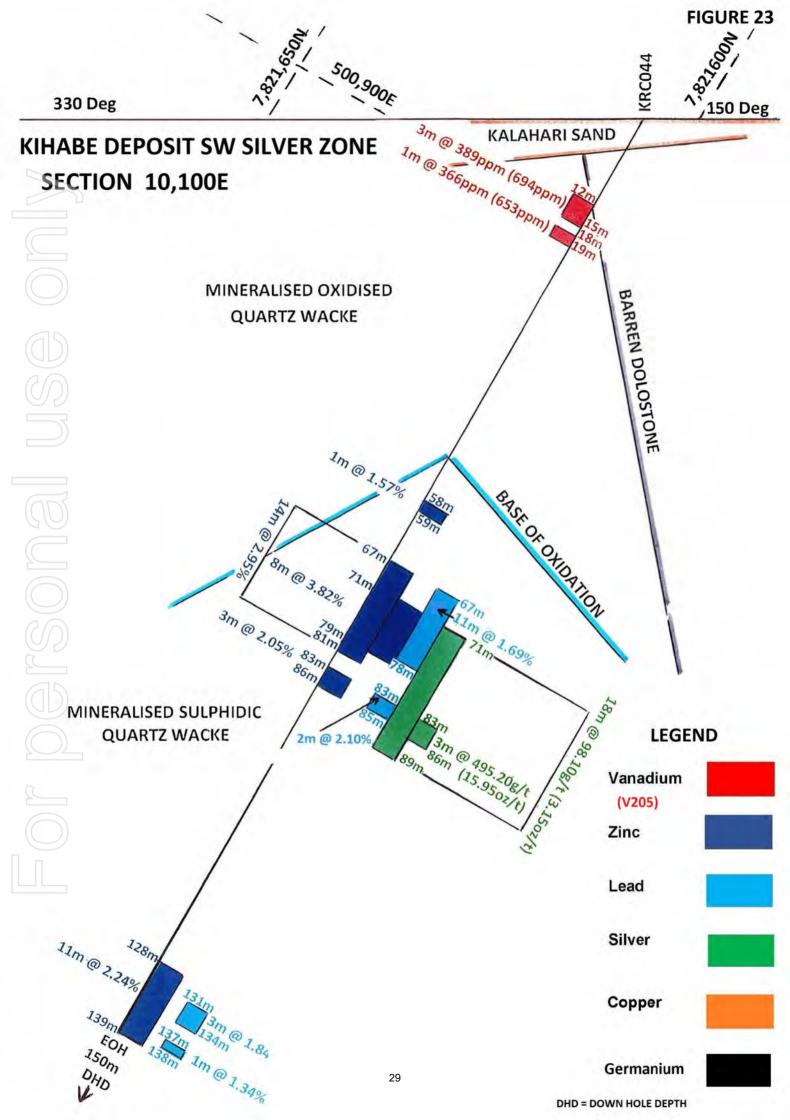

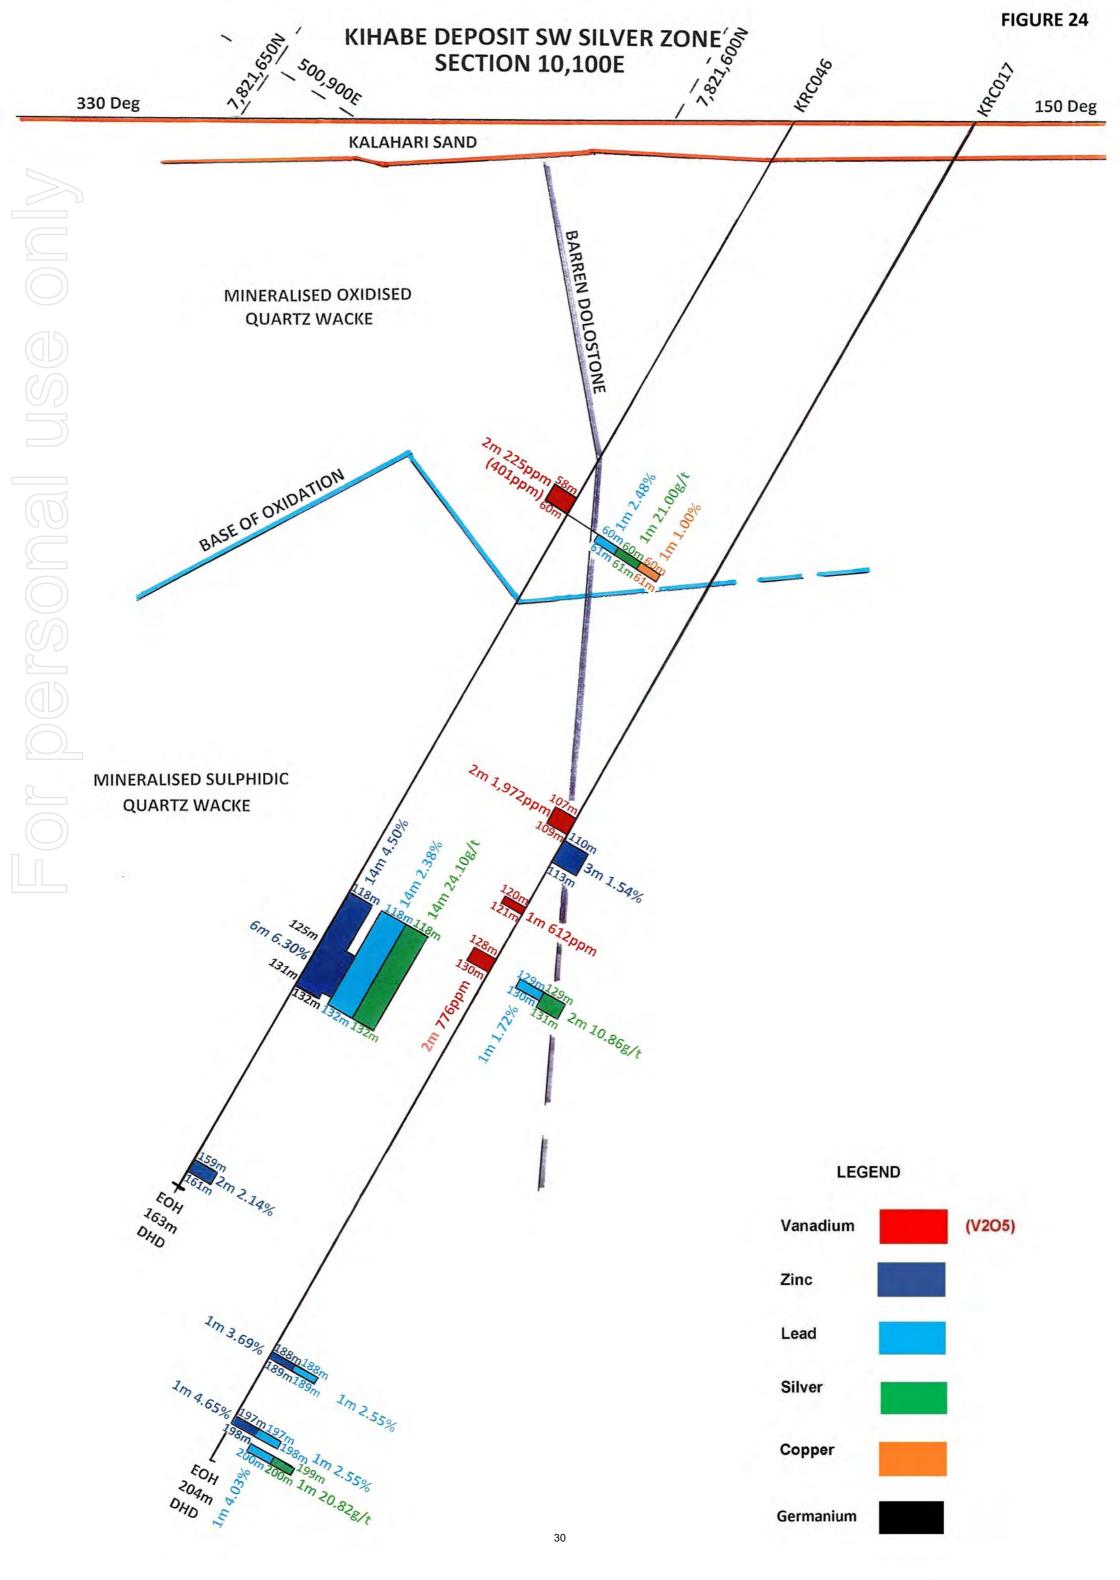

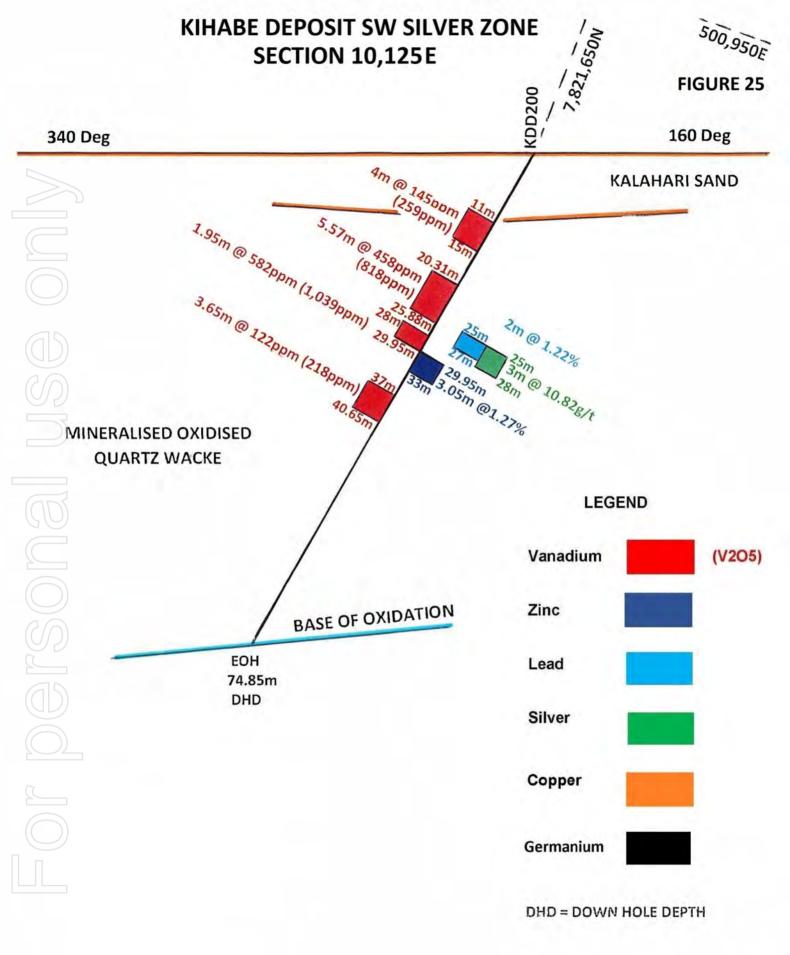

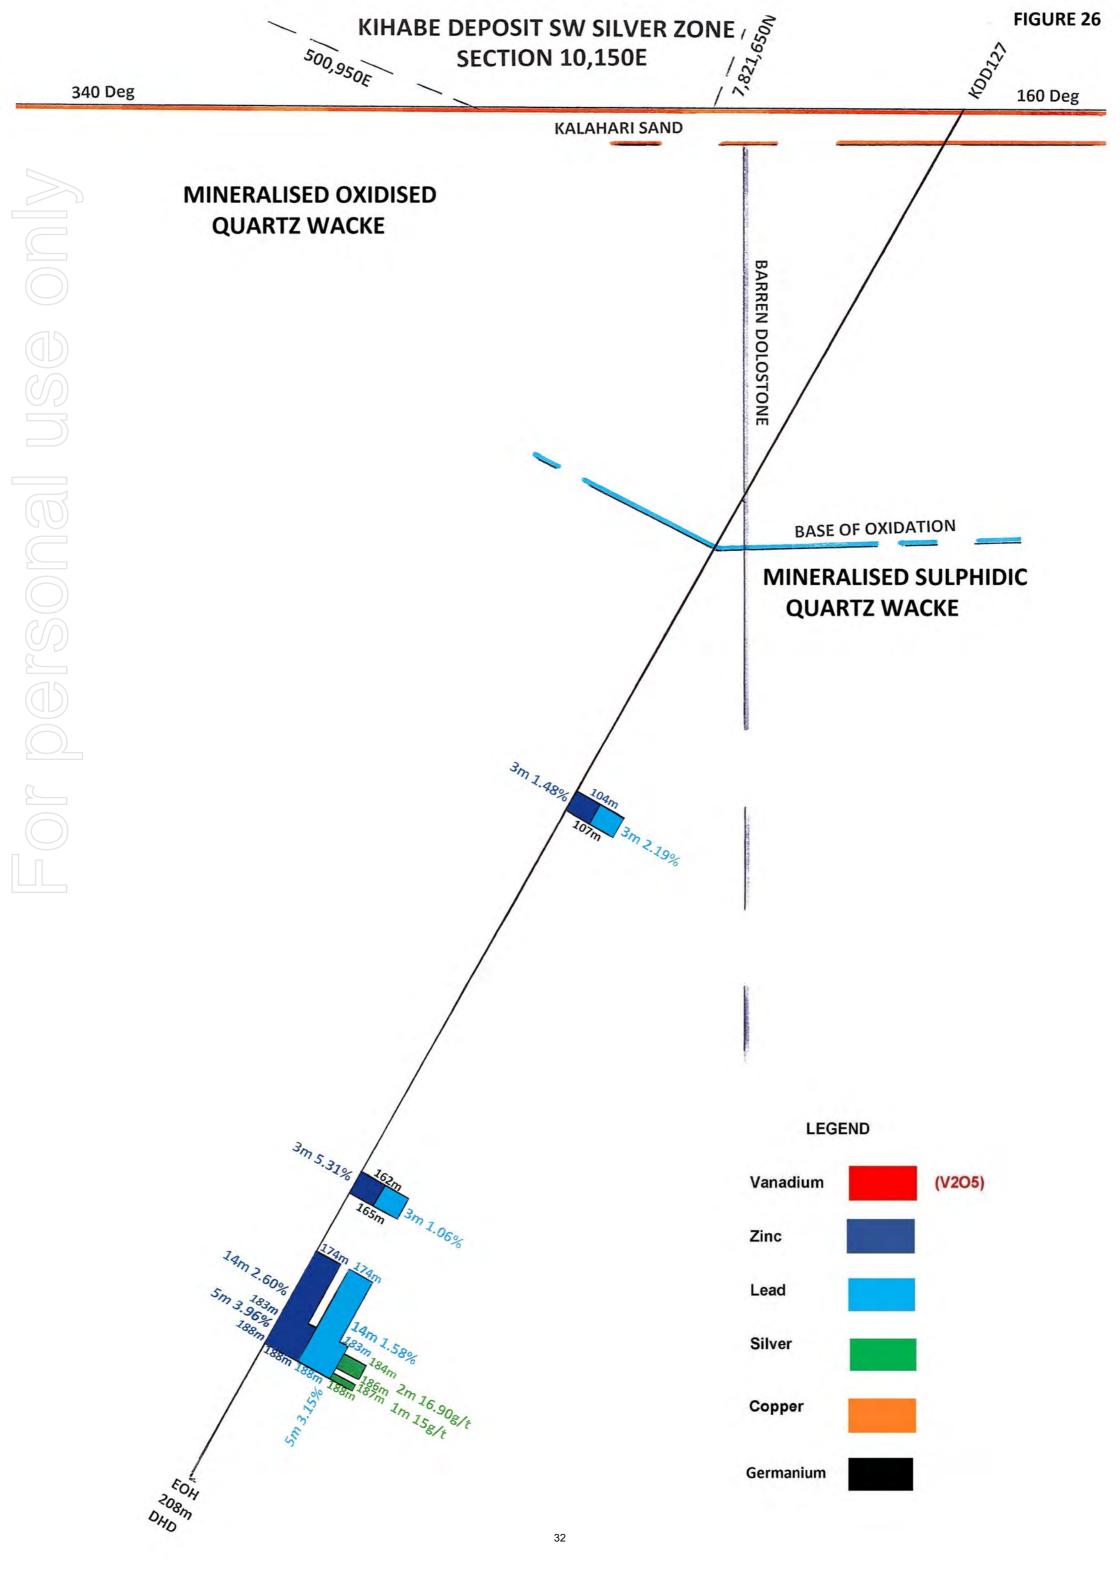

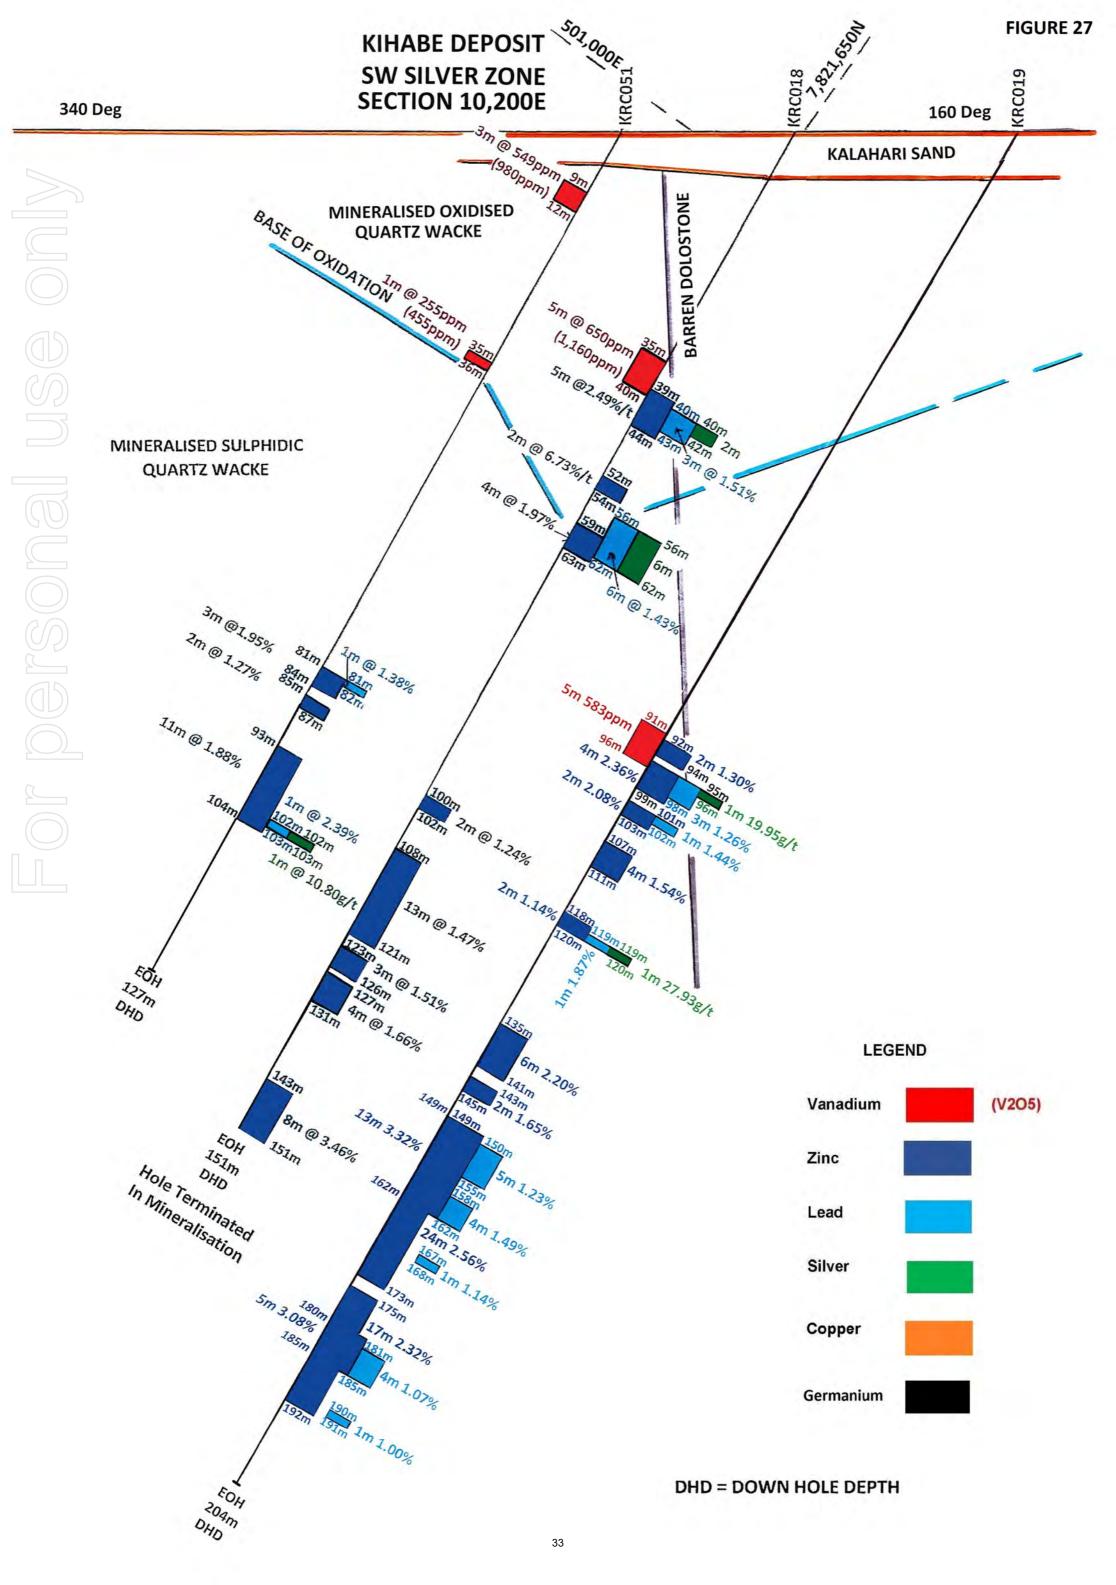

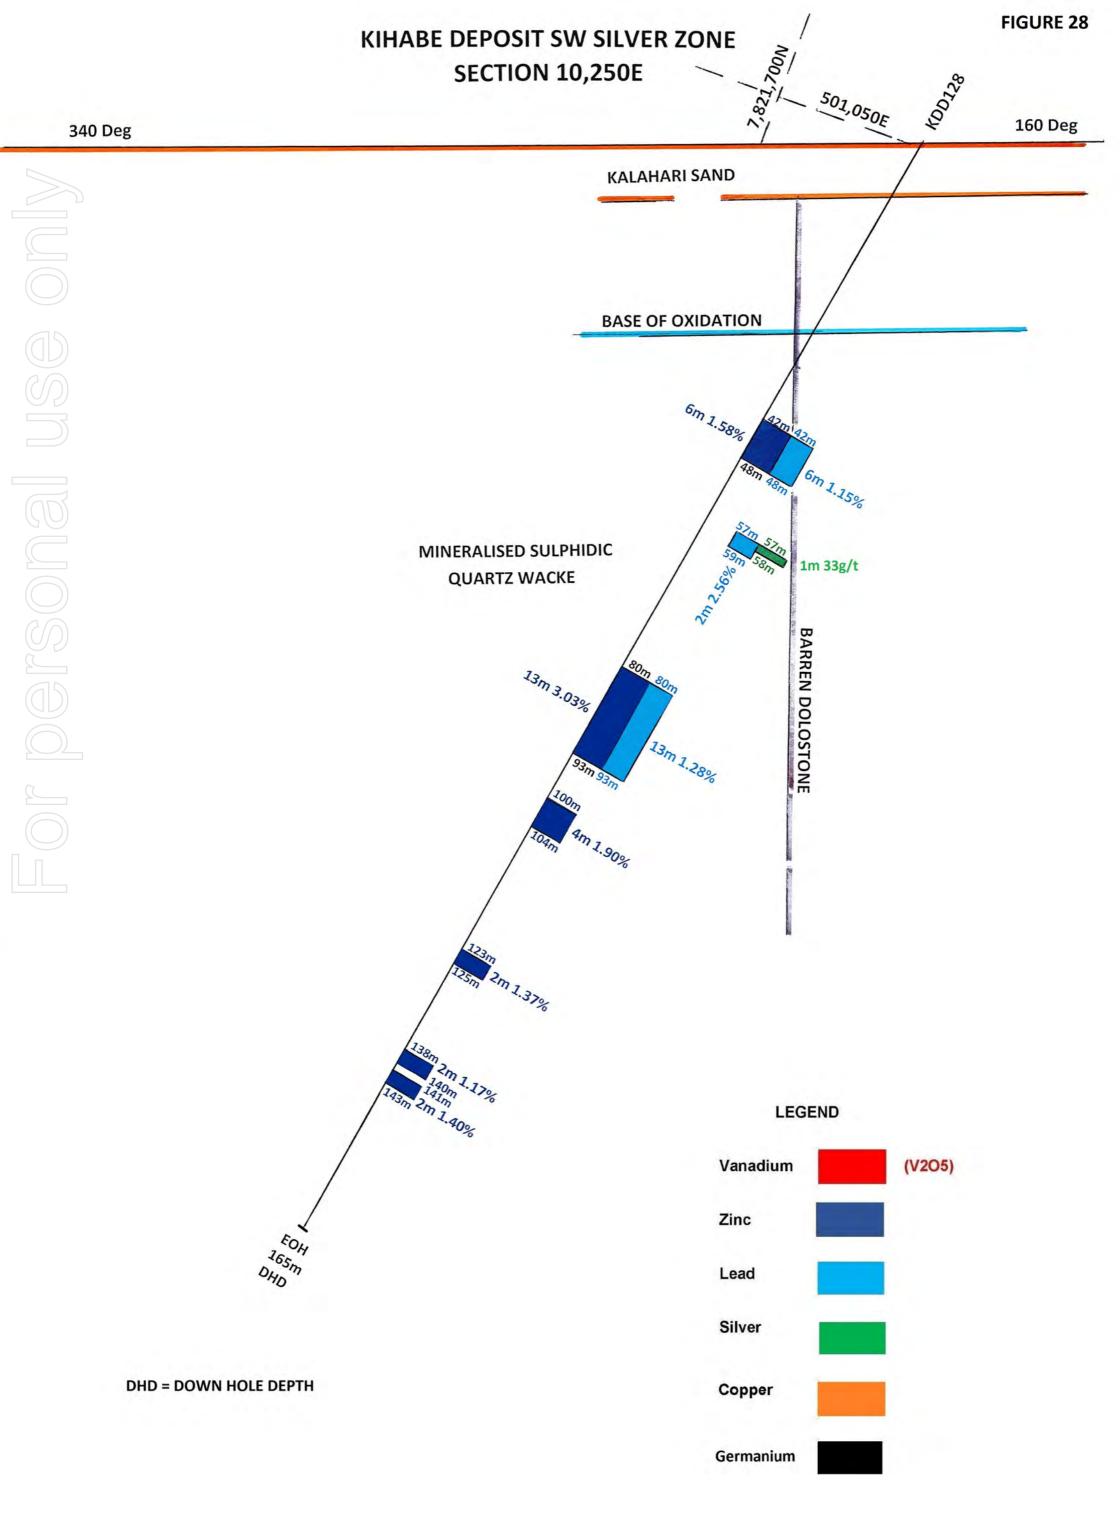

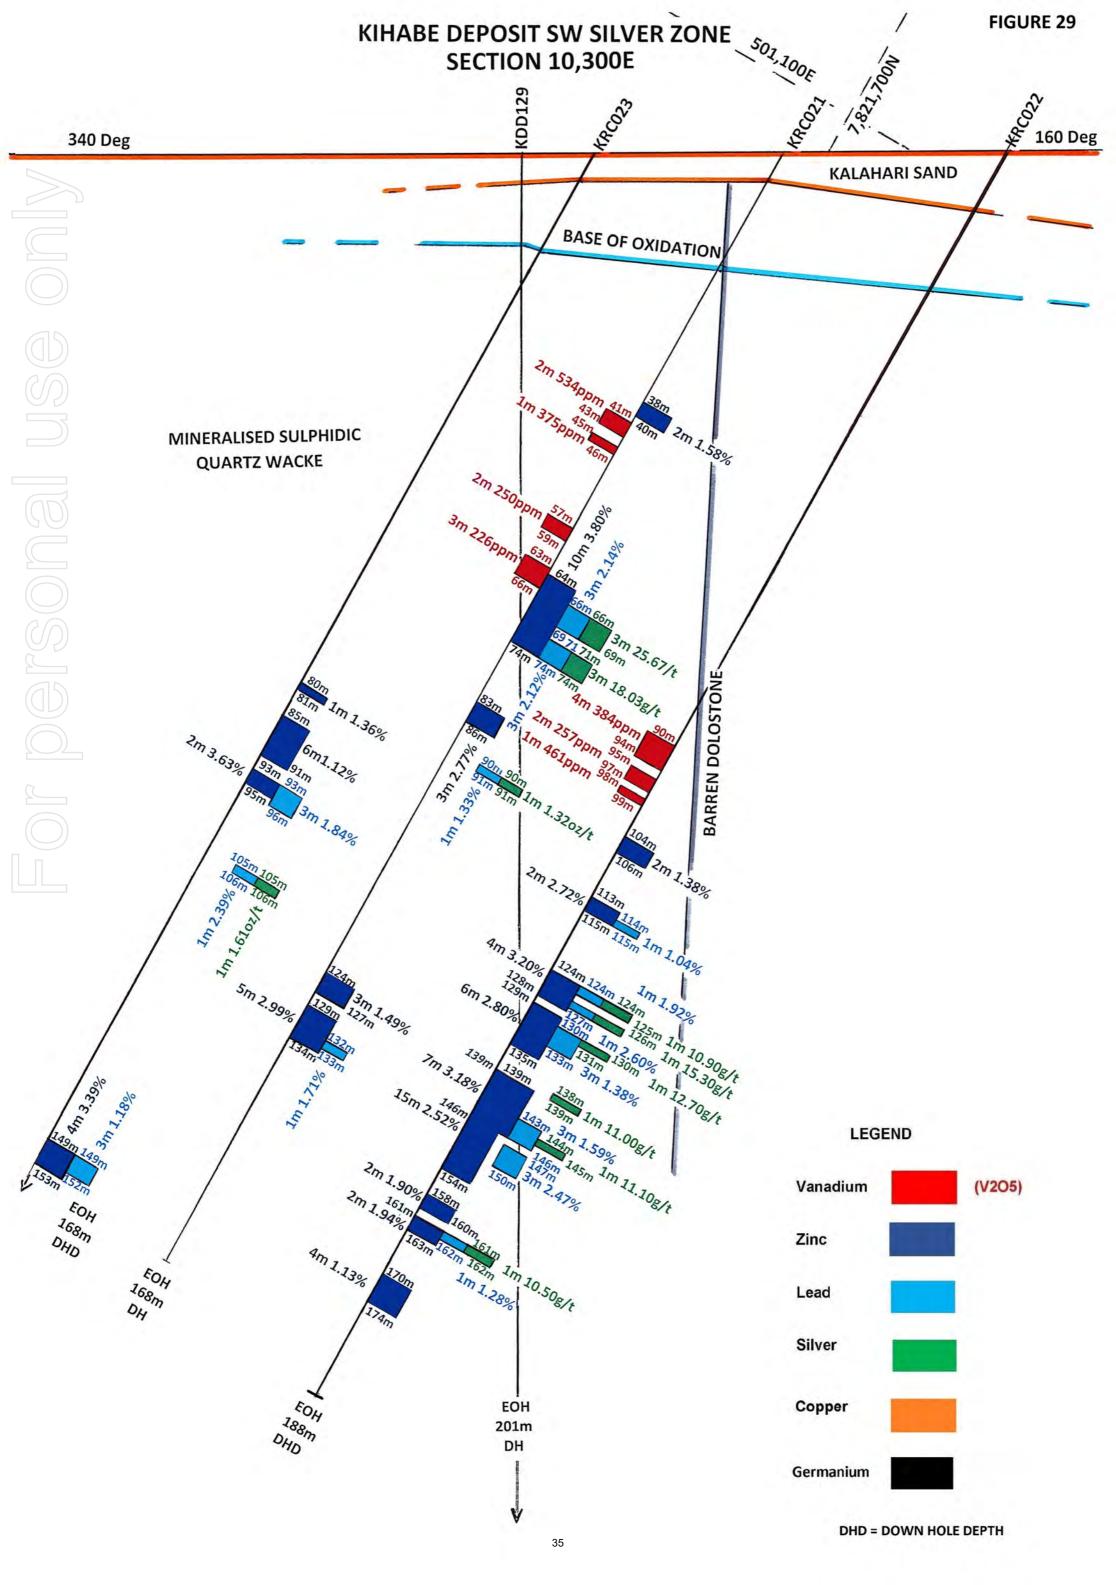

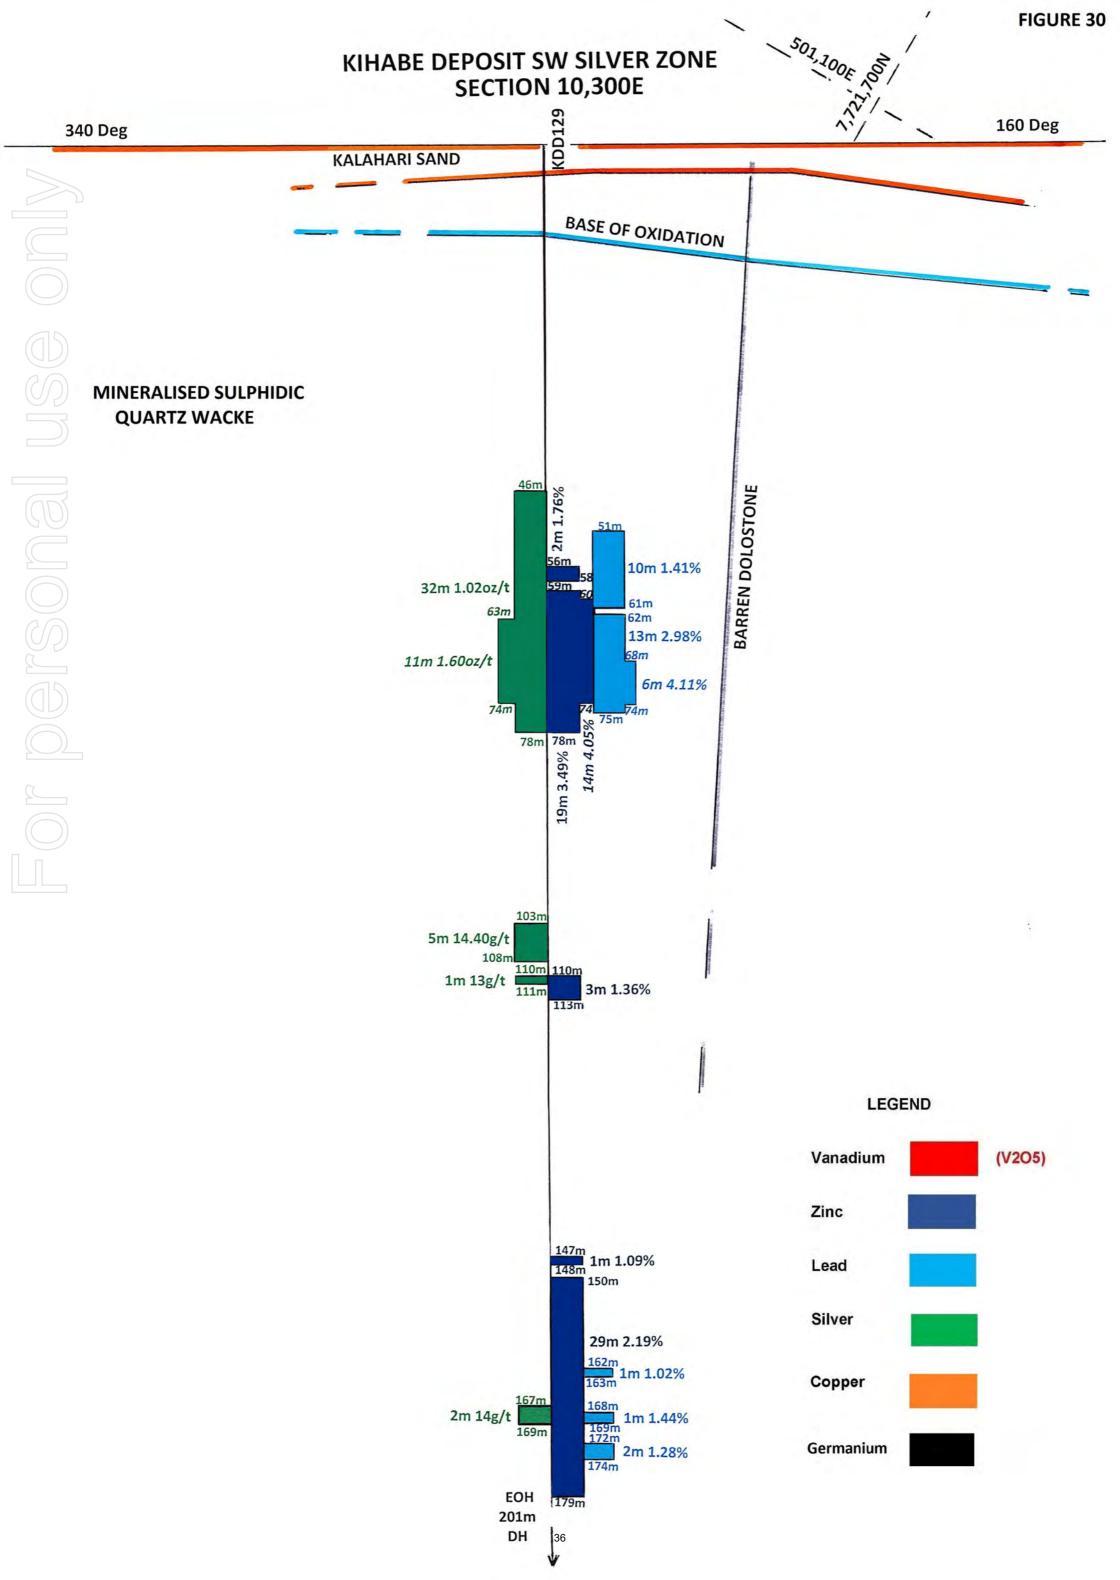

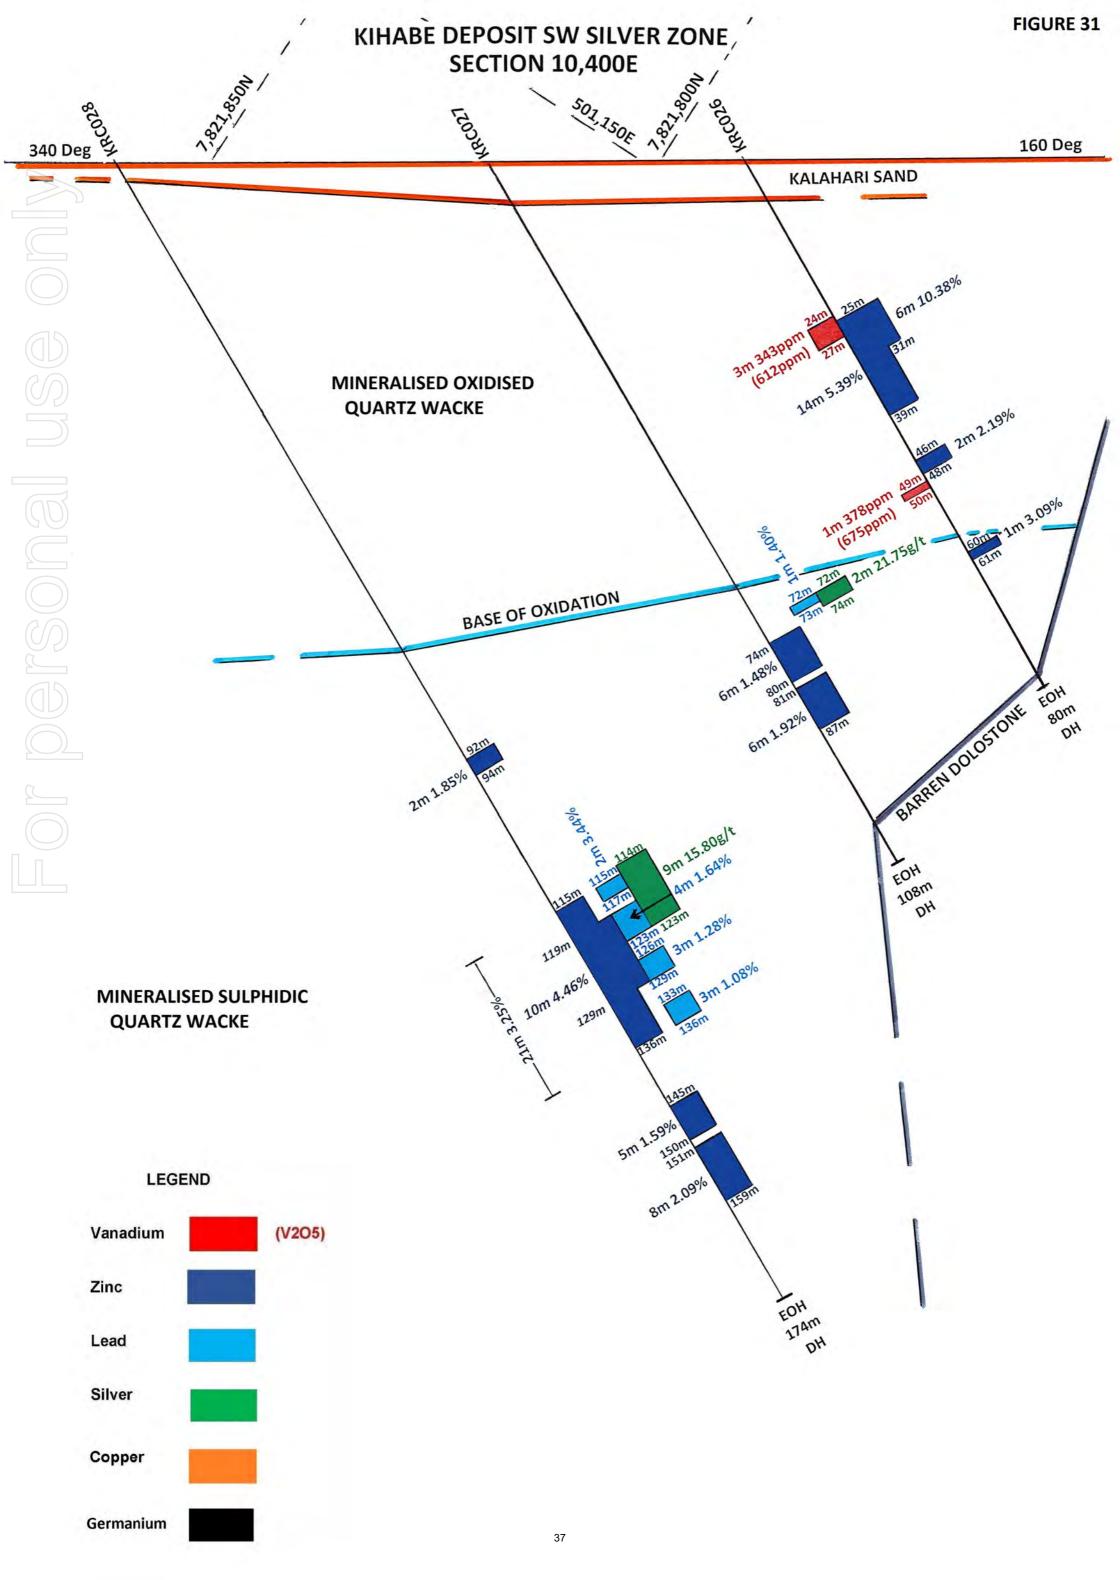

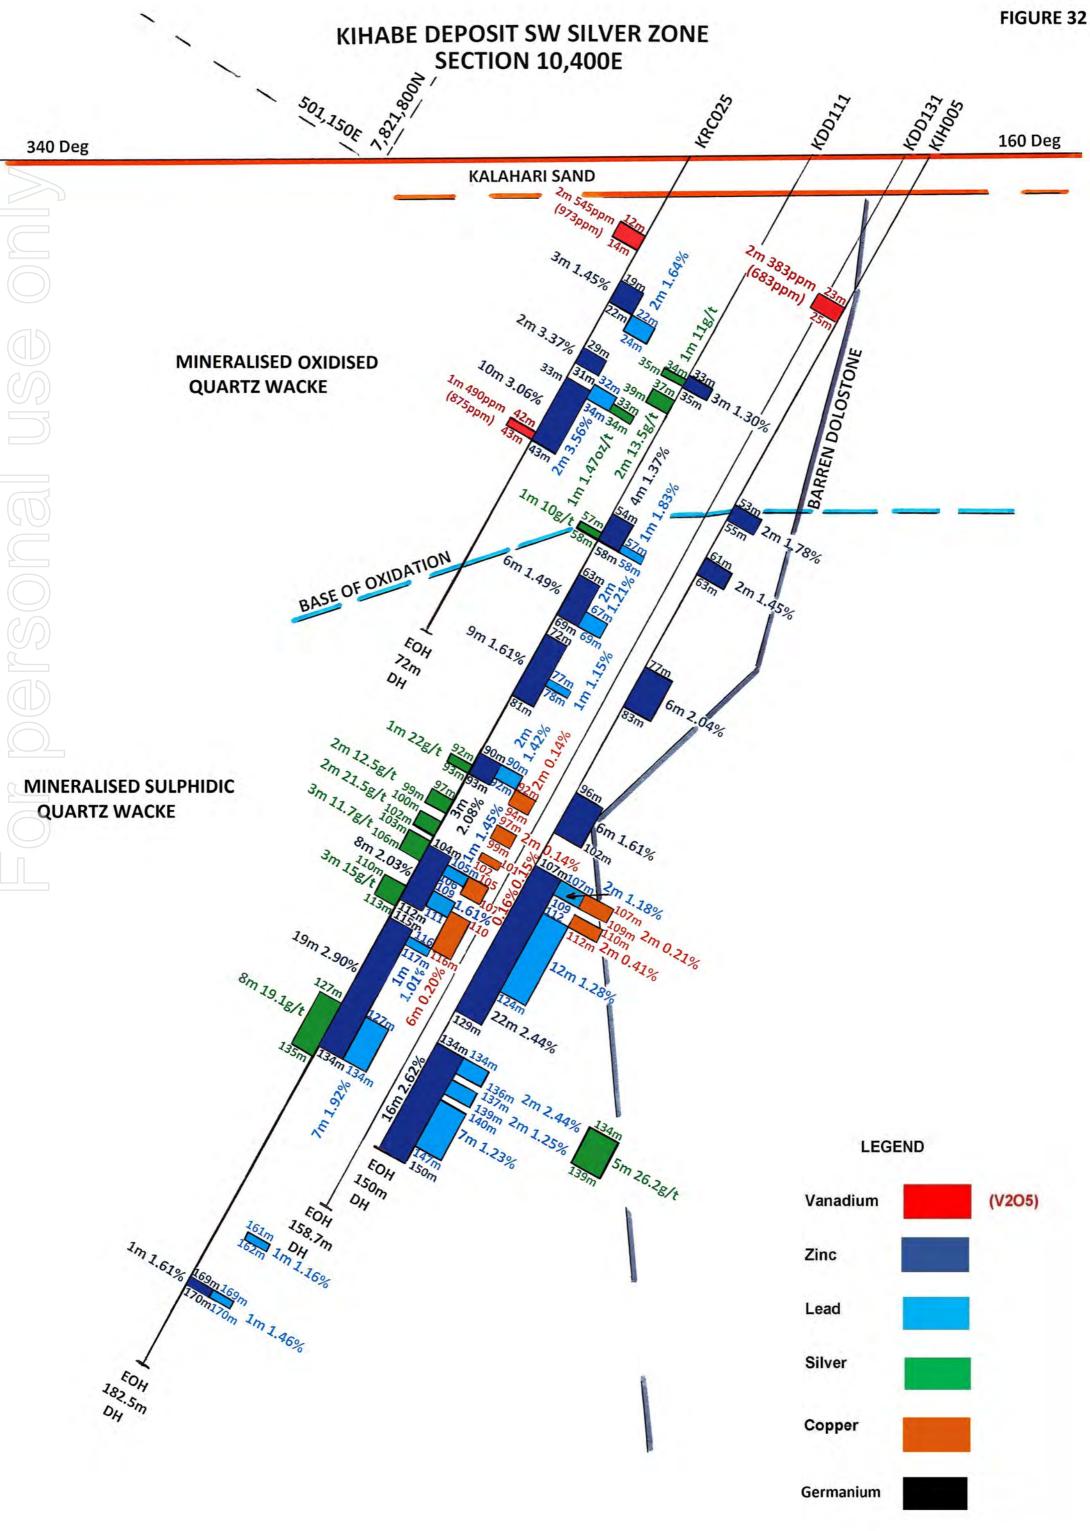

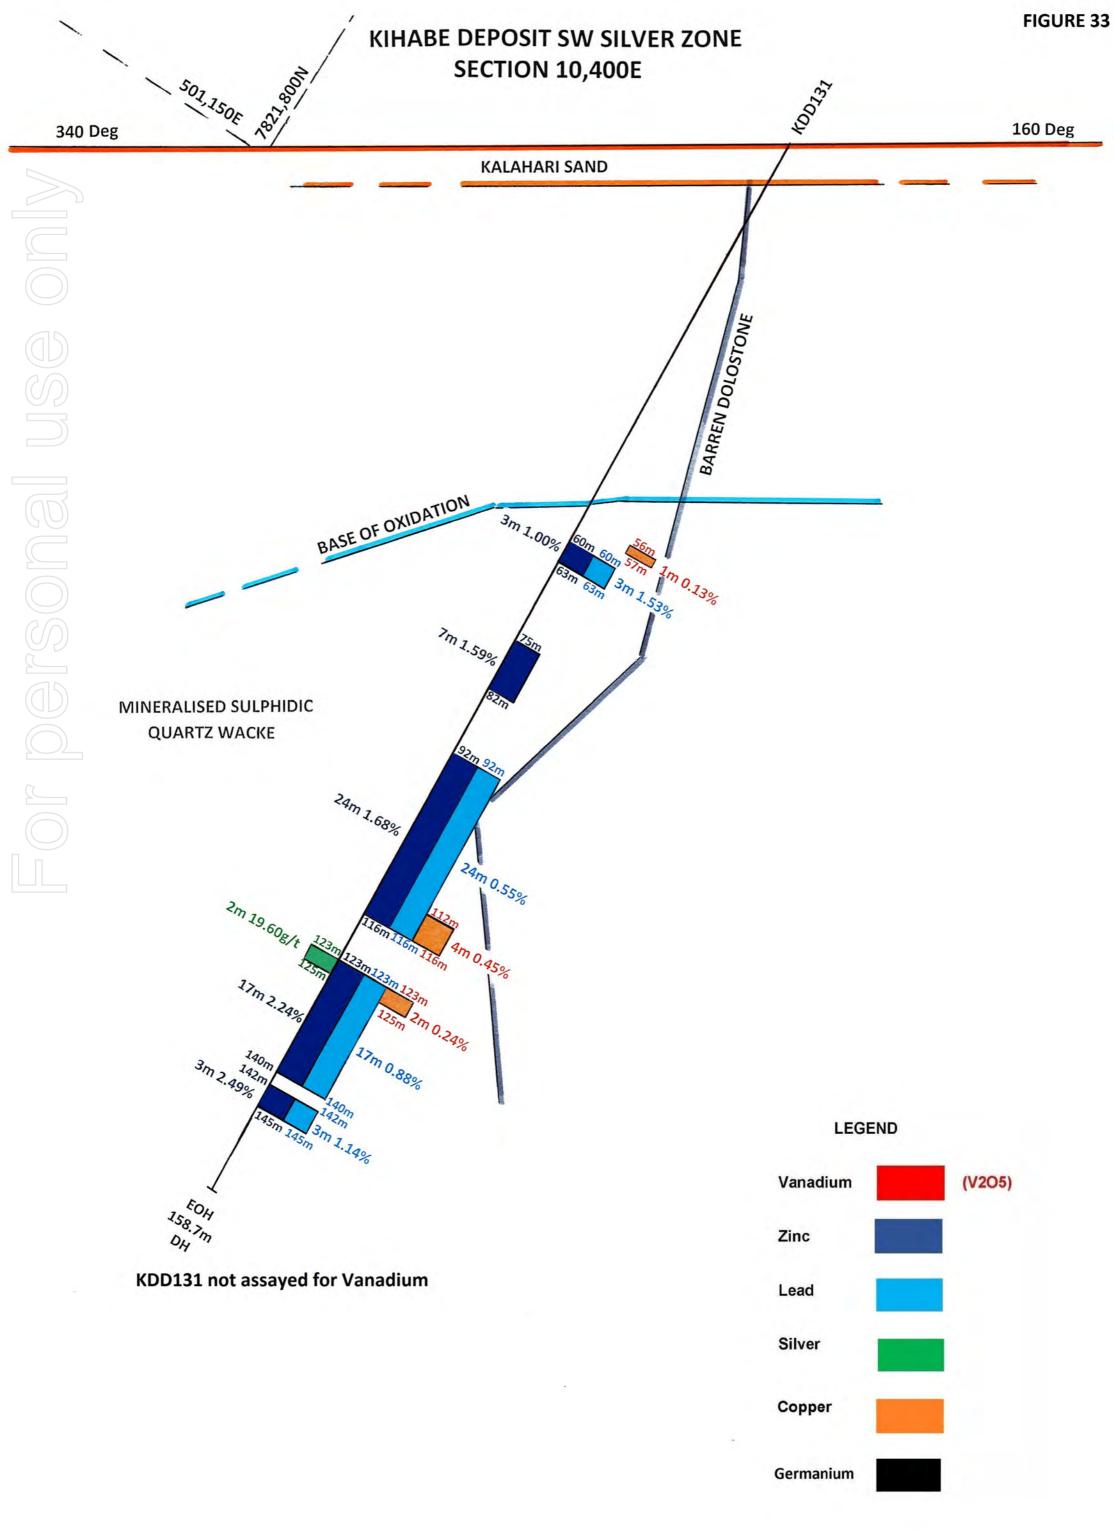

## **Forward Looking Statement**

This report contains forward looking statements in respect of the projects being reported on by the Company. Forward looking statements are based on beliefs, opinions, assessments and estimates based on facts and information available to management and/or professional consultants at the time they are formed or made and are, in the opinion of management and/or consultants, applied as reasonably and responsibly as possible as at the time that they are applied.

Any statements in respect of Ore Reserves, Mineral Resources and zones of mineralisation may also be deemed to be forward looking statements in that they contain estimates that the Company believes have been based on reasonable assumptions with respect to the mineralisation that has been found thus far. Exploration targets are conceptual in nature and are formed from projection of the known resource dimensions along strike. The quantity and grade of an exploration target is insufficient to define a Mineral Resource. Forward looking statements are not statements of historical fact, they are based on reasonable projections and calculations, the ultimate results or outcomes of which may differ materially from those described or incorporated in the forward looking statements. Such differences or changes in circumstances to those described or incorporated in the forward looking statements may arise as a consequence of the variety of risks, uncertainties and other factors relative to the exploration and mining industry and the particular properties in which the Company has an interest.

Such risks, uncertainties and other factors could include but would not necessarily be limited to fluctuations in metals and minerals prices, fluctuations in rates of exchange, changes in government policy and political instability in the countries in which the Company operates.

## Other important Information

**Purpose of document**: This document has been prepared by Mount Burgess Mining NL (MTB). It is intended only for the purpose of providing information on MTB, its project and its proposed operations. This document is neither of an investment advice, a prospectus nor a product disclosure statement. It does not represent an investment disclosure document. It does not purport to contain all the information that a prospective investor may require to make an evaluated investment decision. MTB does not purport to give financial or investment advice.

**Professional advice:** Recipients of this document should consider seeking appropriate professional advice in reviewing this document and should review any other information relative to MTB in the event of considering any investment decision.

**Forward looking statements**: This document contains forward looking statements which should be reviewed and considered as part of the overall disclosure relative to this report.

**Disclaimer:** Neither MTB nor any of its officers, employees or advisors make any warranty (express or implied) as to the accuracy, reliability and completeness of the information contained in this document. Nothing in this document can be relied upon as a promise, representation or warranty.

**Proprietary information**: This document and the information contained therein is proprietary to MTB.

### **Competent Person's Statement:**

The information in this report that relates to drilling results at the Kihabe Deposit fairly represents information and supporting documentation approved for release by Giles Rodney Dale FRMIT who is a Fellow of the Australasian Institute of Mining & Metallurgy. Mr Dale is engaged as an independent Geological Consultant to the Company. Mr Dale has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Mineral Resources and Ore Reserves (the JORC Code)'. Mr Dale consents to the inclusion in this report of the drilling results and the supporting information in the form and context as it appears.

The following extract from the JORC Code 2012 Table 1 is provided for compliance with the Code requirements for the reporting of drilling results.

Section 1 Sampling Techniques and Data (Criteria in this section apply to all succeeding sections).

Criteria	JORC code explanation	Commentary
Sampling	Nature and quality of sampling (eg cut channels, random chips, or specific	Mount Burgess Mining Diamond Core Holes
techniques	specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. • Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralisation that are Material to the Public Report. • In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	HQ Diamond Core was marked and collected in sample trays, visually logged and cut in half. Samples were collected as nominal 1m intervals but based on visible geology with minimum samples of 0.3m and maximum samples of 1.3m. Half of each core was retained on site in core trays and the other half was double bagged and sent to Intertek Genalysis Randburg, South Africa where they were crushed. A portion of each intersection sample was then pulverised to p80 75um and sent to Intertek Genalysis for assaying via ICPMS/OES for Ag/Co/Cu/ Pb/Zn.  Mount Burgess Mining Reverse Circulation Holes  Individual meters of RC drill chips were bagged from the cyclone. These were then riffle split for storage in smaller bags, with selected drill chips being stored in drill chip trays. A trowel was used to select drill chip samples from sample bags to be packaged and sent to Intertek Genalysis, Randburg, South Africa where they were crushed. A portion of each intersection's sample was then pulverised to P80 75um and sent to Intertek Genalysis, Maddington, WA, for assaying via ICP/OES for Ag/Co/Cu/Pb/Zn.
		Mount Burgess Mining Diamond Core Samples submitted for Metallurgical Test Work
		The remainder of the crushed samples were then sent from Intertek Genalysis Randburg to Intertek Genalysis Maddington, Western Australia where they were then collected by the Company for storage. Samples from various intersections from drill holes were selected by the Company for submission for metallurgical test work.
<b>P 5</b>	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	Mount Burgess Mining Diamond Core Holes  HQ diameter triple tube was generally used for diamond core drilling in the oxide zone of the Kihabe Deposit. NQ diameter was generally used in the sulphide zone. Down hole surveys were conducted on all DD holes.
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material	Mount Burgess Mining Diamond Core and RC Holes  Sample recoveries were in general high and no unusual measures were taken to maximise sample recovery other than the use of triple tube core for diamond core drilling. Mount Burgess believes there is no evidence of sample bias due to preferential loss/gain of fine/coarse material.
Logging	Whether core and chip samples have been geologically and geotechnically	Mount Burgess Mining Diamond Core Holes and RC Hole
	logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged.	Holes were logged in the field by qualified Geologists on the Company's log sheet template and of sufficient detail to support future mineral resource estimation: Qualitative observations covered Lithology, grain size, colour, alteration, mineralisation, structure. Quantitative logging included vein percent. SG calculations at ~5m intervals were taken in the DD holes. All holes were logged for the entire length of hole. Logs are entered into MTBs GIS database managed by MTB in Perth.
Sub-sampling	If core, whether cut or sawn and whether quarter, half or all core taken. • If	Mount Burgess Mining Diamond Holes and RC Hole
techniques and sample preparation	non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative	HQ and NQ Core was sawn in half on site. Half of each core was retained on site in core trays and the other half was double bagged and labelled noting Hole# and interval both within the bag and on the bag. Sample bags were then placed in larger bags of ~40 individual samples and the larger bag also labelled describing the contents. Field duplicates were inserted at regular intervals.
	of the in situ material collected, including for instance results for field	All samples currently being reported on were assayed for Ag/Co/Cu/ Pb/Zn.

	duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled	All RC sample bags were labelled with drill hole number and sample interval and collectively stored in larger bags with similar reference. Drill chip trays were all stored separately.
		All samples currently reported on were assayed for Ag/Co/Cu/Pb/Zn.
Quality of assay data and laboratory tests	•The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total •For geophysical tools, spectrometers, hand-held XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibration factors applied and their derivation etc. • nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks ) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	All Mount Burgess Samples  All samples, when originally assayed, were sent to Intertek Genalysis Perth, for assaying according to the following standard techniques:  Diamond Core Samples  (a) Ore grade digest followed by ICP – OES finish for Silver, Lead & Zinc (b) Also 4 acid digest for silver, lead, zinc followed by AAS
	accuracy (i.e. lack of bias) and precision have been established.	RC Samples Ore grade digest followed by ICP-OES for Ag/Co/Cu/Pb/Zn
		Mount Burgess quality control procedures include following standard procedures when sampling, including sampling on geological intervals, and reviews of sampling techniques in the field.
2 16		The current laboratory procedures applied to the Mount Burgess sample preparation include the use of cleaning lab equip. w/ compressed air between samples, quartz flushes between high grade samples, insertion of crusher duplicate QAQC samples, periodic pulverised sample particle size (QAQC) testing and insertion of laboratory pull duplicates QAQC samples according to Intertek protocols.
D 3		Intertek inserts QA/QC samples (duplicates, blanks and standards) into the sample series at a rate of approx. 1 i 20. These are tracked and reported on by Mount Burgess for each batch. When issues are noted the laboratory is informed and investigation conducted defining the nature of the discrepancy and whether further check assar are required. The laboratory completes its own QA/QC procedures and these are also tracked and reported on Mount Burgess. Acceptable overall levels of analytical precision and accuracy are evident from analyses of the routine QAQC data
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data.	All Mount Burgess Samples  Assay results for samples were received electronically from Intertek Genalysis and uploaded into MTB's database managed by MTB at its Perth Office.
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and downhole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control.	All Mount Burgess Holes  Drill hole collar locations were recorded at the completion of each hole by hand held Garmin 62S GPS with horizontal accuracy of approx. 5 metres • Positional data was recorded in projection WGS84 UTM Zone 34S. The accuracy provided by the system employed is sufficient for the nature of the exploratory program. Downhole surveys were also conducted.
Data spacing and distribution	Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied.	All Mount Burgess Holes  Mount Burgess drilling campaigns were undertaken to validate historical drilling as well as to acquire further dat for future resource estimation The data spacing and distribution is currently insufficient to establish the degree of geological and grade continuity appropriate for the estimation of Mineral Resources compliant with the 2012 JORC Code.
<del></del>		Additional drilling will be required to determine the extent of mineralisation and estimate a Mineral Resource compliant with the 2012 JORC Code. Sample compositing was conducted on drill holes, following receipt of assa

Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	All Mount Burgess Holes  Mineralisation was typically intersected at -60 degrees and -90 degrees at the Kihabe Deposit and the Company believes that unbiased sampling was achieved.
Sample security	The measures taken to ensure sample security.	All Mount Burgess Holes  Samples were taken by vehicle on the day of collection to MTB's permanent field camp, and stored there until transported by MTB personnel to Maun from where they were transported via regular courier service to laboratories in South Africa.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	All Mount Burgess Diamond Core Holes
Teviews		A Company Geologist reviewed sampling and logging methods throughout the drilling programs.
		Mount Burgess RC Hole
		MTB's Exploration Geologists continually reviewed sampling and logging methods on site throughout the drilling programs.

# Section 2 Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section).

Criteria	JORC Code Explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	The Kihabe-Nxuu Project is located in north-western Botswana, adjacent to the border with Namibia. The Project is made up of one granted prospecting licence - PL 43/2016, which covers an area of 1000 sq km. This licence is 100% owned and operated by Mount Burgess. The title is current at the time of release of this report, with a renewal granted in November 2020 to 31 December 2022.
		PL 43/2016 is in an area designated as Communal Grazing Area.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The licence is in good standing and no impediments to operating are currently known to exist.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	The Geological Survey of Botswana undertook a program of soil geochemical sampling in 1982. As a result of this program, Billiton was invited to undertake exploration and drilling activities in and around the project area. Mount Burgess first took ownership of the project in 2003 and has undertaken exploration activities on a continual basis since then.
Geology	Deposit type, geological setting and style of mineralisation.	The Kihabe-Nxuu Project lies in the NW part of Botswana at the southern margin of the Congo craton The Gossan Anomaly is centred on an exposed gossan within the project. To the north of the project are granitoids, ironstones, quartzites and mica schists of the Tsodilo Hills Group covered by extensive recent Cainozoic sediments of the Kalahari Group. Below the extensive Kalahari sediments are siliciclastic sediments and igneous rocks of the Karoo Supergroup in fault bounded blocks.
Drill hole Information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:	Information material to the understanding of the exploration results reported by Mount Burgess is provided in the text of the public announcements released to the ASX.  No material information has been excluded from the announcements.
	easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar	
	dip and azimuth of the hole	
	down hole length and interception depth	
	hole length	
	If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract	

Criteria	JORC Code Explanation	Commentary
	from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.  Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.  The assumptions used for any reporting of metal equivalent values should be clearly stated.	All Mount Burgess Holes  No data aggregation methods have been used.
Relationship between mineralisation widths and intercept lengths	These relationships are particularly important in the reporting of Exploration Results.  If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.  If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').	All Mount Burgess Holes  The geometry of the mineralisation with respect to the drill hole angle is typically at -60 degrees at the Kihabe Deposit which is considered representative from a geological modelling perspective.
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	All Mount Burgess Holes  Appropriate maps, sections and mineralised drill intersection details are provided in public announcements released to the ASX. Refer to the Company's website <a href="https://www.mountburgess.com">www.mountburgess.com</a> .
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	Exploration results reported in Mount Burgess public announcements and this report are comprehensively reported in a balanced manner.
Other Substantive Exploration Data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations, geophysical survey results, geochemical survey results, bulk samples – size and method of treatment, metallurgical test results, bulk density, ground water, geotechnical and rock	

Criteria	JORC Code Explanation	Commentary
	characteristics, potential deleterious or contaminating substances.	
Further work	The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).	Further works planned at the Project include additional drilling and surface mapping at the Kihabe-Nxuu Zinc/Lead/Silver/Germanium and Vanadium Project.
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.
