Commentary at a glance

Performance

In the month under review the Company's NAV total return was 2.8% and the FTSE All-Share Index total return was 2.5%.

Contributors/detractors

The largest positive contributors tended to be companies with potential takeover offers (Hippgnosis, Anglo American and Tyman). The largest detractors were underweight positions in large index weights (AstraZeneca and Shell).

Outlook

The low valuation of the UK equity market (versus both overseas peers and its own history) makes us positive on the outlook for UK equities.

Company overview

Objective

The Company aims to give shareholders a higher than average return with growth of both capital and income over the medium to long-term, by investing in a broad spread of predominantly UK companies. The Company measures its performance against the FTSE All-Share Index Total Return.

Highlights

A growth and income company with a diversified portfolio of mainly UK equities and a strong dividend track record.

Fund Manager commentary

Investment environment

April was a strong month for the UK equity market, led by banking shares (following broadly well-received results from the likes of NatWest and Barclays) as well as mining shares (following a rise in the price of key commodities such as copper, as well as a takeover approach for Anglo American by BHP).

Outside of Anglo American, takeover activity within the UK equity market continued. For example, IDS (previously Royal Mail) rejected a takeover approach from its largest shareholder, while building hardware supplier Tyman accepted an offer from a US peer.

Portfolio review

The Company's best performing holdings during April tended to be companies subject to potential takeovers including Hipgnosis Songs Fund (a position we subsequently sold), Tyman and Anglo American. Shares in specialist materials producer Morgan Advanced Materials also performed well following a capital markets day in which it guided to better-than-expected organic growth and margins.

The largest detractors from relative performance were the Company's underweight positions in large index weights that performed well, specifically AstraZeneca, Shell and HSBC. DS Smith also performed poorly following the announcement from Mondi that it was not intending to make a takeover offer for the company.

During the month we purchased a new position in autos supplier Dowlais, which is a relatively new listing on the UK market having spun out of Melrose. The company has substantial market share among the world's biggest auto manufacturers, and has been right-sizing its manufacturing footprint in recent years, as well as reducing central costs such as procurement. These cost reductions mean the company is expecting to see improvement in its margins over the coming years, which we felt was not reflected in the valuation at the time of purchase.

Manager outlook

The UK equity market continues to trade at a substantial valuation discount to overseas equities, and we are seeing evidence of this in the number of takeovers (both accepted and rejected) so far this year. Historical evidence suggests that starting valuations materially impact long-term shareholder returns. The current valuation of UK equities, being lower than both its own history and overseas equities, makes us positive on the UK market outlook.

Glossary

Discount/Premium

The amount by which the price per share of an investment company is either lower (at a discount) or higher (at a premium) than the net asset value per share (cum income), expressed as a percentage of the net asset value per share.

Gearing

The effect of borrowing money for investment purposes (financial gearing). The amount a company can “gear” is the amount it can borrow in order to invest. Gearing is used in the expectation that the returns on the investments bought will exceed the costs of the borrowings that funded the purchase. This Company can also use synthetic gearing through derivatives and foreign exchange hedging and/or other non-fully funded instruments or techniques.

Leverage

The Company's leverage is the sum of financial gearing and synthetic gearing. Details of the Company's leverage limits can be found in both the Key Information Document and Annual Report. Where a company utilises leverage, the profits and losses incurred by the company can be greater than those of a company that does not use leverage.

Market capitalisation

Share price multiplied by the number of shares in issue, excluding treasury shares, at month end. Shares typically priced mid-market at month-end closing.

Net Asset Value (NAV)

The total value of a Company's assets less its liabilities.

NAV (Cum Income)

The value of investments and cash, including current year revenue, less liabilities (prior charges such as loans, debenture stock and preference shares at fair value).

NAV (Ex Income)

The value of investments and cash, excluding current year revenue, less liabilities (prior charges such as loans, debenture stock and preference shares at fair value).

NAV total return

The theoretical total return on shareholders' funds per share reflecting the change in Net Asset Value (NAV) assuming that dividends paid to shareholders were reinvested at NAV at the time the shares were quoted ex-dividend. A way of measuring investment management performance of investment trusts which is not affected by movements in discounts/premiums.

Net assets

Total assets minus any liabilities such as bank loans or creditors.

Net cash

A company's net exposure to cash/cash equivalents expressed as a percentage of shareholders' funds, after any offset against its gearing. This is only shown for companies that have gearing in place.

Net gearing

A company's total assets (less cash/cash equivalents) divided by shareholders' funds expressed as a percentage.

Ongoing charges

The total expenses for the financial year (excluding performance fee), divided by the average daily net assets, multiplied by 100.

Risk rating

The key measure used to assess risk is volatility of returns, using historic net asset value (NAV) performance of the Company over 1 and 3 years. In this instance volatility measures how much a company's NAV fluctuates over time in relation to the UK Equity market. The higher a volatility figure, the more the NAV has fluctuated (both up and down) over time. Please note that risk categorisations are indicative and based principally on historic data and should not be solely relied upon when making investment decisions.

Share price

Closing mid-market share price at month end.

Share price total return

The theoretical total return to the investor assuming that all dividends received were reinvested in the shares of the company at the time the shares were quoted ex-dividend. Transaction costs are not taken into account.

Total assets

Cum Income NAV multiplied by the number of shares, plus prior charges at fair value.

Yield

Calculated by dividing the current financial year's dividends per share (this will include prospective dividends) by the current price per share, then multiplying by 100 to arrive at a percentage figure.

Overall Morningstar Rating™ is shown for an investment company achieving a rating of 4 or 5.

Company specific risks

- This Company is suitable to be used as one component of several within a diversified investment portfolio. Investors should consider carefully the proportion of their portfolio invested in this Company.
- Active management techniques that have worked well in normal market conditions could prove ineffective or negative for performance at other times.
- The Company could lose money if a counterparty with which it trades becomes unwilling or unable to meet its obligations to the Company.
- Shares can lose value rapidly, and typically involve higher risks than bonds or money market instruments. The value of your investment may fall as a result.
- The return on your investment is directly related to the prevailing market price of the Company's shares, which will trade at a varying discount (or premium) relative to the value of the underlying assets of the Company. As a result, losses (or gains) may be higher or lower than those of the Company's assets.
- If a Company's portfolio is concentrated towards a particular country or geographical region, the investment carries greater risk than a portfolio that is diversified across more countries.
- Some of the investments in this portfolio are in smaller company shares. They may be more difficult to buy and sell, and their share prices may fluctuate more than those of larger companies.
- The Company may use gearing (borrowing to invest) as part of its investment strategy. If the Company utilises its ability to gear, the profits and losses incurred by the Company can be greater than those of a Company that does not use gearing.

Not for onward distribution. Before investing in an investment trust referred to in this document, you should satisfy yourself as to its suitability and the risks involved, you may wish to consult a financial adviser. This is a marketing communication. Please refer to the AIFMD Disclosure document and Annual Report of the AIF before making any final investment decisions. Past performance does not predict future returns. The value of an investment and the income from it can fall as well as rise and you may not get back the amount originally invested. Tax assumptions and reliefs depend upon an investor's particular circumstances and may change if those circumstances or the law change. Nothing in this document is intended to or should be construed as advice. This document is not a recommendation to sell or purchase any investment. It does not form part of any contract for the sale or purchase of any investment.
