

Child and Family Experiences in Head Start FACES Programs in Spring 2022: The 2021–2022 Study

OPRE Report #2024-198

September 2024

ACKNOWLEDGMENTS

The authors would like to express their appreciation to our Project Officers, Nina Philipsen, Alysia Blandon, and Laura Hoard; to Krystal Bichay-Awadalla, Casey Gunn, Jacquelyn Gross, Kylee Probert, Neda Senehi, and Brian Tchen; and to other federal staff at OPRE and the Office of Head Start. We thank the Mathematica team, including Andrew Weiss, Sara Skidmore, Alex Hollister, Barbara Lepidus Carlson, Louisa Tarullo, Hanzhi Zhou, Cathy Lu, Scilla Albanese, Kathleen Feeney, Maya Reid, Diletta Mittone, Morgan Woods, Rhiannon Jones, Tatiana Santiago, Timothy Luyster, John McCarthy, David Naglee, Sam Lem, Scott Peters, Lauren O'Keefe, Joe McClurkin, John Carsley, James Valenzuela, Ryan McInerney, Andrew MacTaggart, Cole Garvey, Tiffany Waits, Cheri Vogel, Mary Kalb, Macy Miller, Amelia Forman, Kevin Manbodh, Meghan Clough, Max Miller, Raquel Whitt, Kelsey Bagwell, Eric Grau, Sharon Clark, Effie Metropoulos, and Jennifer Brown, as well as Season Bedell, Richard Godwin, Karen Markoswki, Lucy Tindall, Sean Harrington, and Daniella Turner at the Survey Operations Center and all of the Mathematica field and telephone staff who collected the data. Most of all, we offer our gratitude to the staff, families, and children of the programs across the country, who once again opened their doors and shared their time with us, particularly in such a difficult time as during the COVID-19 pandemic.

Child and Family Experiences in Head Start FACES Programs in Spring 2022: The 2021-2022 Study

OPRE Report #2024-198

September 2024

Tutrang Nguyen, Davis Straske, Natalie Reid, Elizabeth Doran, Charlotte Cabili, Carla Chavez, Aden Bhagwat, Jeffrey Harrington, Addison Larson, Judy Cannon, Victoria Sims, Barbara Carlson, Ashley Kopack Klein, and Sara Bernstein

OVERVIEW

Head Start is a national program that helps prepare young children from families with low incomes and other eligible families prepare to succeed in school. It does this by working to promote children’s early learning and health and their families’ well-being. Head Start connects families with medical, dental, and mental health services to ensure that children are receiving the services they need to support their development. Head Start also involves parents in their children’s learning and development and helps parents make progress on their own goals, such as housing stability, continuing education, and financial security (Administration for Children and Families 2020). Head Start provides grants to local public and private nonprofit and for-profit agencies. The agencies in turn deliver comprehensive services to children and families with low incomes.

Introduction

In 2021, the Office of Planning, Research, and Evaluation in the Administration for Children and Families, U.S. Department of Health and Human Services, contracted with Mathematica to design and conduct the 2021–2022 Study of Family and Staff Well-Being in Head Start Family and Child Experiences Survey Programs (the 2021–2022 Study). The 2021–2022 Study builds on the Head Start Family and Child Experiences Survey (FACES). This report includes information on the 2021–2022 Study design and presents key findings from the study’s spring 2022 data collection on Head Start children and families. The tables in this report describe children and families in spring 2022 as COVID-19 continued to impact the country.

The 2021–2022 Study collected data in Regions I through X from Head Start parents and teachers in fall 2021 and spring 2022. These data provide descriptive information about the characteristics, experiences, well-being, and needs of Head Start children and families. This report presents data from spring 2022 on Head Start children and families. For some characteristics, it also presents data on changes between fall 2021 and spring 2022. N. Reid and colleagues present data from spring 2022 on Head Start staff (2024). For more information about data from fall 2021 from Head Start parents and teachers, see Doran and colleagues (2024).

Methods

This report includes data gathered from two sources in spring 2022 that are presented in this report:

1. A survey of children’s parents, in which children’s primary caregivers answered questions about their children in Head Start FACES programs and their households.
2. A teacher child report (TCR) survey, in which teachers answer questions about the development of specific children in their classrooms.

The 2021-2022 Study also gathered data from these sources in fall 2021. In spring 2022, a total of 1,837 children were eligible and consented. Nine hundred twenty-eight children’s parents completed the parent survey (51 percent of consented children’s parents) and teachers completed TCRs for 1,250 children (68 percent of children whose parents gave consent for them to participate).

Spring 2022 data collection for the 2021-2022 Study occurred during the COVID-19 pandemic and participation and response rates were low. The data in this report provide a window into the experiences of a sample of Head Start children and families who were able to participate in spring 2022 data collection between April and July 2022. Although we *selected* a nationally representative sample of children and teachers in fall 2021, fewer children and their families participated in the 2021–2022 Study than expected. Readers should not assume the data are nationally representative of all Head Start children and their families. These data provide a snapshot of the experiences of Head Start children and their families during this difficult time and describe them in spring 2022 as COVID-19 continued to impact the country.

Topics

The 2021–2022 Study focused on the characteristics, experiences, well-being, and needs of Head Start children, families, and staff.

The findings in this report explore Head Start child and family characteristics, including:

1. Children’s characteristics, family background, and home environment in spring 2022, and any changes from fall 2021 to spring 2022
2. Children’s social-emotional and learning skills in spring 2022, and any changes from fall 2021 to spring 2022
3. Children’s disability status and physical health status in spring 2022, and any changes from fall 2021 to spring 2022

Purpose

This report provides (1) information about the 2021–2022 Study, including the background, design, methodology, assessments, and analytic methods; and (2) detailed findings on children and families.

Key Findings and Highlights

For children’s characteristics, family background, and home environment ([Section A](#)), the tables show:

- Demographic characteristics (for example, age, race/ethnicity, gender, language(s) spoken in the home, child’s primary caregiver(s), who lives in the household) in spring 2022
- Parents’ level of completed education and employment status in spring 2022
- Family economic well-being (for example, total household income and household income as a percentage of federal poverty threshold) in spring 2022 and fall 2021 to spring 2022 change
- Family housing status, stability, and quality in spring 2022
- Parents’ mental health (for example, depressive symptoms scores, anxiety symptoms scores, parenting behaviors and stress) in spring 2022 and fall 2021 to spring 2022 change
- Parents’ overall health status in spring 2022 and fall 2021 to spring 2022 change

- Household routines (for example, reading to the child and bedtime and family dinner routines) in spring 2022 and fall 2021 to spring 2022 change
- Parents' report of relationship with the child in spring 2022 and fall 2021 to spring 2022 change
- Parents' child care plans for next year as of spring 2022
- Strategies parents use to meet child care needs outside of their regular child care arrangements in spring 2022
- Parents' participation in and satisfaction in Head Start activities in spring 2022
- Parents' report of program staff's culturally responsive practices in spring 2022
- Reasons parents decided to enroll their child in Head Start in spring 2022
- Parents' report of children's participation in virtual learning activities in spring 2022 and fall 2021 to spring 2022 change
- Parents' report of preferences for mode of participation in Head Start activities in Spring 2022
- Social and community supports available to and useful for parents in spring 2022

For children's social-emotional and learning skills ([Section B](#)), the tables show:

- Reliability of and scores for teacher-reported items that measure children's social skills, problem behaviors, approaches to learning, and literacy skills scores in spring 2022 and fall 2021 to spring 2022 change
- Reliability of and scores for parent-reported approaches to learning in spring 2022 and fall 2021 to spring 2022 change
- Teacher-reported early literacy skills in spring 2022 and fall 2021 to spring 2022 change
- Teacher-reported math knowledge and skills in spring 2022 and fall 2021 to spring 2022 change

For children's disability status and physical health status ([Section C](#)), the tables show:

- Teacher's report of child's disability status and type and Individualized Education Program (IEP) or Individual Family Service Plan (IFSP) status in spring 2022
- Parent's report of child's health status in spring 2022 and fall 2021 to spring 2022 change

The tables provide this information for all Head Start children. For some characteristics, the tables also provide the information by child age or Head Start exposure (those who were newly entering Head Start versus those who were returning for a second year in fall 2021).

GLOSSARY OF KEY TERMS

2021–2022 Study. The 2021–2022 Study of Family and Staff Well-Being in Head Start Family and Child Experiences Survey Programs.

Analysis weights. A value applied to each child, parent, or teacher observation to help results better represent the broader population of Head Start children, their families, programs, classrooms, or teachers in Regions I–X.

Anxiety symptoms. Feelings of nervousness, worrying, restlessness, or irritability.

Approaches to learning. Children’s motivation, attention, organization, persistence, and independence in learning.

Composite. A characteristic created from more than one question.

Confidence interval. A range of values within which the true estimate is expected to lie.

Covariate. A variable, or data item, that is plausibly related to key study outcomes and included in an analysis of relationships between variables.

COVID-19 (coronavirus disease 2019). An infectious disease that was declared a pandemic by the World Health Organization and a public health emergency by the U.S. Centers for Disease Control and Prevention in March 2020. The public health emergency ended in May 2023.

Depressive symptoms. Feelings of sadness, hopelessness, or restlessness.

Fall–spring change. A calculation of the difference between the fall and spring estimates; specifically, whether mean values or percentages statistically differed between fall and spring.

Lead teacher. The head or primary teacher in the classroom, as identified by center staff.

Learning skills. Children’s cognitive skills, such as literacy (for example, recognizing letters) and mathematics (such as counting and sorting).

Nationally representative. A sample that represents a national population. For example, FACES 2019 collected data from a sample of Head Start children and families in Regions I–X that represent the national Head Start population in Regions I–X.

Nonresponse bias analysis. An analysis examining (1) whether important outcomes seem like they might be biased because of the people who did not respond, and (2) whether weights the researcher applied lessen the severity of this bias for the items tested.

Raw score. The original score of an assessment. Raw scores are calculated by adding the item values or averaging the item values in the assessment. A raw score provides the value out of the total number possible; for example, scoring 8 out of 10 would be a raw score of 8. Raw scores are not compared to other respondents of the same age nationally or converted to a standard scale.

Standard deviation. The amount of variation or spread of a set of scores or values.

Standard error. The estimate of the standard deviation of each score or value.

Weighted percentage. Analysis weights were applied to parent survey and teacher child report data so estimates would better represent the broader population of Head Start children and families in Regions I–X.

I. INTRODUCTION

Head Start is a national program that helps young children from families with low incomes and other eligible families prepare to succeed in school. It does this by working to promote children’s early learning and health and their families’ well-being. Head Start connects families with medical, dental, and mental health services to ensure that children are receiving the services they need to support their development. Head Start also involves parents in their children’s learning and development and helps parents make progress on their own goals, such as housing stability, continuing education, and financial security (Administration for Children and Families 2020). Head Start provides grants to local public and private nonprofit and for-profit agencies. The agencies in turn deliver comprehensive child development services to children and families with low incomes.

A. The 2021–2022 Study

In 2021, the Office of Planning, Research, and Evaluation, in the Administration for Children and Families (ACF) at the U.S. Department of Health and Human Services, contracted with Mathematica to design and conduct the 2021–2022 Study of Family and Staff Well-Being in Head Start Family and Child Experiences Survey (FACES) Programs (the 2021–2022 Study). The 2021–2022 Study builds on the Head Start Family and Child Experiences Survey (FACES).

The 2021–2022 Study collected data in Regions I through X from Head Start parents and teachers in fall 2021 and spring 2022, and from Head Start program directors and center directors in spring 2022. These data provide descriptive information about the characteristics, experiences, well-being, and needs of Head Start children, families, and staff. This report presents data from spring 2022 on Head Start children and families. N. Reid and colleagues (2024) present data from spring 2022 on Head Start staff. For more information about data from fall 2021 from Head Start parents and teachers, see Doran and colleagues (2024).

The 2021–2022 Study differs from previous FACES in two key ways:

- Although we *selected* a nationally representative sample of children in fall 2021, fewer children and their families participated in the 2021–2022 Study than expected. Readers should not assume the data are nationally representative of all Head Start children and their families. These data provide a snapshot of the experiences of Head Start children and their families during this difficult time and describe them in spring 2022 as COVID-19 continued to impact the country (see [Overview of Analytic Methods](#) section for more information on response rates).
- Due to health and safety precautions because of the ongoing COVID-19 pandemic, we did not collect direct child assessments or classroom observation data.

B. Data tables in the current report

The tables in this report include findings on children and families from spring 2022.¹ The data reported in the tables are based on aspects of the Head Start logic model, which suggests that program inputs (such as resources and funding or staff characteristics) are linked with the activities provided by Head Start (such as staff support, curricula, and assessments). Those activities in turn produce key outputs (such as quality of instruction and children’s attendance) that lead to child and family development and well-being outcomes (M. Reid et al. 2024).

Spring 2022 data collection for the 2021-2022 Study occurred during the COVID-19 pandemic and participation and response rates were low. The data in this report provide a window into the experiences of a sample of Head Start children and families who were able to participate in spring 2022 data collection between April and July 2022. Readers should not assume the data are representative of all Head Start children and families nationally. These data provide a snapshot of the experiences of Head Start children and families during this difficult time.

The tables in this report describe children and families in spring 2022 as COVID-19 continued to impact the country.

- [Section A](#) includes tables on children’s characteristics, family background, and home environment. We examine these characteristics to understand the children in the sample and how their experiences in Head Start might fit into the larger context in which they are developing in their families and homes (Burchinal et al. 2002; Bryk and Schneider 2003; Fantuzzo and McWayne 2002; Lopez et al. 1999; Yoshikawa et al. 2013). Head Start programs may use this information to shape services to meet the needs of the children and families who participate.
- [Section B](#) includes information on children’s social-emotional and learning skills and shows these skills by their background characteristics (age, previous Head Start experience). This information could have implications for classroom management and teaching practices.
- [Section C](#) includes information on differences in children’s physical health and disability status and shows this information by their background characteristics (age, previous Head Start experience). This information could have implications for classroom practice and for supportive services to meet the needs of children.

Each section includes a set of tables focusing on characteristics in spring 2022, and a subset of tables focusing on change during the program year (fall 2021 to spring 2022). Many of these items were collected both in fall 2021 and in spring 2022, making it possible to measure change, for example, growth in children’s reported skills and behaviors by comparing the scores in fall 2021 and spring 2022. We highlight fall–spring change that is statistically significant at the $p \leq .05$ level and lower and therefore, is unlikely to differ due to chance. Tables focusing on fall–spring change only include cases with valid data on the construct in both the fall and the spring.

¹ See N. Reid et al. (2024) for findings on classrooms and programs from spring 2022; see Doran et al. (2024) for findings on children, families, and teachers from fall 2021.

Because many tables include data from more than one instrument or from both waves (fall 2021 and spring 2022), a source note under each table describes the instrument(s) and wave(s) that are sources for the data in the table.² Some tables use fall 2021 data to create subgroups that provide the information by age or Head Start experience (those who were newly entering Head Start versus those who were returning for a second year in fall 2021).

Standard error tables are in Sections AA (children’s characteristics, family background, and home environments), BB (social-emotional and learning skills), and CC (children’s physical health and disability status). These tables show the estimate of the standard deviation of each reported average (also called a weighted mean) or percentage. Readers can use the standard deviations presented in the standard error tables to determine the precision of the estimates. A larger standard error signifies a wider confidence interval around the estimate. For example, a 95 percent confidence interval means that we can be 95 percent sure that the range of values included in the confidence interval contains the true mean or percentage of the population, based on our sample design. We describe precision of estimates in the [Overview of Analytic Methods](#) section.

In this report, we use several specialized terms that are commonly used in the early childhood field. We define those terms in a list of [key terms](#) (page ix). We also include a [list of acronyms](#) (page xi).

² The 2021-2022 Study included parent surveys in fall 2021, with data collected from October 2021 to January 2022. Some questions were asked in a respondent’s first survey only (for example, questions about languages spoken in the child’s home). For tables reporting on these questions, data is drawn from fall surveys for respondents who completed surveys in fall only, or in fall and spring. For respondents who completed a survey in spring only, their data is drawn from the spring survey.

This page has been left blank for double-sided copying.

II. OVERVIEW OF SAMPLE AND OF DATA COLLECTION METHODS FOR HEAD START CHILDREN AND FAMILIES

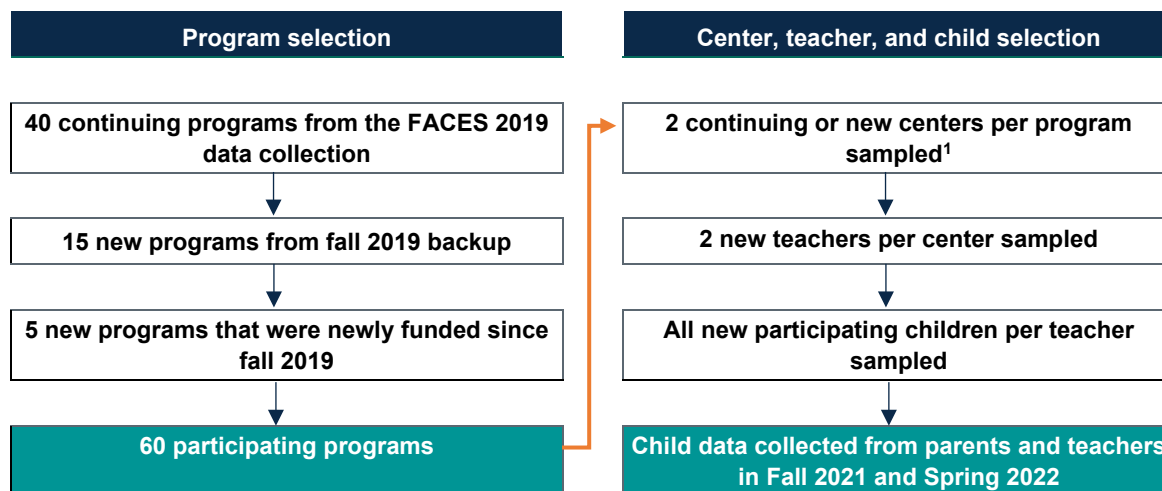

In this chapter, we describe how we used the sample from a previous study, FACES 2019, as a basis for the 2021–2022 Study sample and how the spring 2022 sample builds from the fall 2021 sample. We also discuss our methods for collecting data from Head Start families and teachers, including the surveys we fielded in the spring 2022 data collection period, the context of the COVID-19 pandemic, and the number of completed surveys.

A. The 2021–2022 Study sample

The 2021–2022 Study was designed to sample 60 programs, two centers per program, two teachers per center, and all children within sampled teachers’ classrooms, as shown in Exhibit II.1.³ To select a sample of Head Start programs for the 2021–2022 Study, we started with the program sample from FACES 2019.⁴ Of the 59 sampled programs that participated in FACES 2019 in fall 2019, 40 agreed to participate again in fall 2021. We then used backup programs from the fall 2019 sample to add 15 more program participants. We also updated the program sample in an effort to ensure that it was nationally representative of all Head Start programs by sampling programs that were newly funded since the time of the 2019 sample. This resulted in five new programs that participated in fall 2021, for a total of 60 participating programs.

In programs that participated in fall 2019, we selected the same centers from 2019. If any of these centers had closed, we re-sampled centers for the program. We then selected teachers within the sampled and participating centers. For each teacher, we sampled all children in the teacher’s classroom for the study.

Exhibit II.1. Flow of 2021–2022 Study sample selection

¹ For continuing programs whose sampled centers had not closed, we kept the same centers; otherwise, we selected new centers.

³ The number of centers and teachers that were sampled could vary depending on program structure: for example, a program might have only one center or only one teacher in a center.

⁴ For information on FACES 2019 sampling, see Kopack Klein et al. (2021).

B. Spring 2022 data collection methods

Sampling, recruitment, and data collection for fall 2021 and spring 2022 took place remotely as the COVID-19 pandemic continued to have widespread effects in the United States.⁵ Although most child care and early education (CCEE) settings, including Head Start programs, had reopened their physical buildings by the start of the 2021-2022 Study data collection, most CCEE settings faced increased health and safety protocols and staffing challenges, as compared to before the pandemic (Grose 2021).

Preparation for spring 2022 data collection began with determining which children selected in the fall were still eligible for the spring data collection (those still enrolled in Head Start at the time of data collection). Additionally, due to the low participation rates in fall 2021, consent collection for children selected in the fall continued into spring 2022. Despite the continued parental consent collection into spring 2022, participation and response rates in spring 2022 continued to be lower than expected. We discuss the implications of these response rates in the [Overview of Analytic Methods](#) section.⁶

Marginal participation rates are the percentage of sampled participants that agreed to participate. For children participating in the 2021-2022 Study, marginal participation is the percentage of sampled, eligible children whose parents consented to participate. In spring 2022, the marginal participation for children was 66 percent (Exhibit II.2). We collected parent surveys and teacher child reports (TCRs) from parents and teachers of eligible and consented children from April through July of 2022. The parent survey was administered either via web or computer-assisted telephone interviewing (CATI). The TCR was administered via web or paper.⁷ Although we sent surveys to all parents and teachers who agreed to participate, some did not complete their surveys. The marginal response rates—the percentage of respondents that completed data collection among those who agreed to participate—were lower than expected, which was consistent with other CCEE research during the pandemic (Tout et al. 2023). Marginal response rates are reported in Exhibit II.2.

⁵ We conducted in-person recruitment in a limited number of programs in spring 2022 in an effort to boost participation rates.

⁶ More detailed information on nonresponse and nonresponse bias analysis is in the 2021–2022 Study User’s Manual (M. Reid et al. 2024).

⁷ Refer to the 2021–2022 Study User’s Manual (M. Reid et al. 2024) for more detail on survey administration and consent procedures.

Exhibit II.2. Spring 2022 participation and response rates

Instrument	Selected and eligible in spring 2022^a	Participants in spring 2022^b	Participation rate in spring 2022^c (percentage)	Number of completed instruments in spring 2022	Response rates in spring 2022 (percentage)^d
Parent survey (child level)	2,783	1,837	66	928	51
Teacher child report (child level)	2,783	1,837	66	1,250	68

^aWe initially sampled a total of 3,252 children. Among those children, 2,783 remained after sibling subsampling and accounting for children who left Head Start between fall and spring.

^bParticipants are children whose parents consented to participate in the study. Parents and teachers may not have completed all the relevant instruments. Child participation reflects participation in spring 2022.

^cThis is a marginal (not cumulative) unweighted participation rate. Marginal participation rates are the percentage of the eligible sample that chose to participate, meaning children whose parents consented to participate among those who were eligible.

^dThis is a marginal (not cumulative) unweighted response rate. The parent survey response rate reflects the percentage of parents who completed surveys among children whose parents consented to their participation in the study. The TCR response rate reflects the percentage of teachers who completed TCRs among children whose parents consented to their participation in the study.

Of those parents and teachers who completed surveys, most did so in May and June 2022 (Exhibit II.3).

Exhibit II.3. Completed parent surveys and TCRs, by month

Instrument	April 2022	May 2022	June 2022	July 2022	Total
Parent survey	109	464	245	110	928
TCR	133	774	218	125	1250

Note: These values reflect the monthly distribution of 928 parents who completed spring 2022 parent surveys and 1,250 teachers who completed spring 2022 TCRs.

The child's primary caregiver completed the parent survey, regardless of whether this person identified as the child's parent. In spring 2022, 88 percent of respondents to the parent survey identified themselves as the child's biological mother and 6 percent identified themselves as the child's biological father. Three percent identified themselves as the child's grandparent or great-grandparent. The remaining respondents identified themselves as the child's foster parent, stepparent, sibling or step-sibling, other relative, or other non-relative.

Most data in the tables in this report present information from the parent surveys and TCRs. Some of the data come from the Survey Management System (SMS), which is the system the study team uses to track respondent information. The SMS contains information from the parental consent forms for each child, such as child age.

III. OVERVIEW OF ANALYTIC METHODS FOR HEAD START CHILDREN AND FAMILIES

Because participation and response rates were lower than expected, readers should not assume the 2021–2022 Study data are nationally representative of all Head Start children or families. Estimates are based on Head Start parents and teachers who were able to respond to the surveys during the COVID-19 pandemic. The findings in this report provide a snapshot of the experiences of Head Start children and families during this difficult time.

In this section, we describe our methods for analyzing spring 2022 data about children and families from parents and teachers in the 2021–2022 Study. First, we present different types of missing data and then address a key concern raised by low participation and response rates: nonresponse bias. We discuss how we assess nonresponse bias, including the limitations of nonresponse bias analysis. Then, we describe who the estimates in the data tables represent when weighted, and we discuss the precision of the estimates presented in this report. In addition, we describe how we indicate when respondents could select all response options that applied to a question. Finally, we describe how we conducted subgroup analyses and fall–spring change analyses.

A. Missing data

The number of children within and across tables can vary depending on item nonresponse, which happens when there are data from a parent survey or TCR for a child, but a specific item within that instrument is missing. This can happen if someone chooses not to respond to a particular item. For example, in the parent survey, the survey might not display an item because of the parent’s earlier response to a “gateway” item. Rates of item-level missing data are low in the 2021–2022 Study. Data on key characteristics such as children’s race and ethnicity, age, sex, and language that is always or usually spoken to child in the home are present for all sample members or missing in less than 1 percent of cases. We include a table note when sample sizes are lower than expected due to high item-level missingness.

Another type of missing data is unit nonresponse, which occurs when the entire parent survey or TCR is missing. Rates of unit nonresponse are higher in the 2021–2022 Study than in FACES studies conducted before 2020. Our approach to addressing unit nonresponse is to use analysis weights.⁸ We discuss the potential implications of unit nonresponse, and weighting to adjust for sampling and nonresponse, next.

B. Limitations and features of nonresponse bias analysis

Nonresponse bias can occur when people who did not participate in data collection or respond to surveys (nonrespondents) would have responded differently enough from those who did participate (respondents) to change the results. That is, they could bias the results by not participating in data collection. This is of particular concern when response rates are low. A

⁸ For more information about how to handle nonresponse in 2021–2022 Study data, see the 2021–2022 Study User’s Manual (M. Reid et al. 2024).

lower response rate does not necessarily indicate the presence of nonresponse bias, but a higher response rate does lower the risk of it.

For the 2021–2022 Study and as described in [Chapter II](#), although we selected a nationally representative sample of Head Start children, fewer children and their families participated than expected. We set a response rate target of 85 percent for each survey, meaning we aimed to receive completed parent surveys and TCRs for 85 percent of children.

Bias cannot be measured directly. This is because we do not know how the nonrespondents would have responded to a given question, so we are unable to measure bias in our survey outcomes (for example, we cannot know whether nonrespondents have different levels of depressive symptoms than respondents). Instead, we conducted a nonresponse bias analysis (Bose 2001; U.S. Census Bureau 2023). We were only able to indirectly test for potential bias using information (covariates) we had for both respondents and nonrespondents to see whether there are differences (for example, size of their Head Start program by total enrollment). Specifically, we tested whether 14 covariates differed for respondents and nonrespondents. There may be other characteristics that we were not able to test that are also related to nonresponse bias after weighting.

To conduct the nonresponse bias analysis, we applied statistical weights that adjusted the estimates – to the extent possible – to account for those who did not respond to the surveys. For the 14 covariates, we examined whether the nonresponse-adjusted weights had lessened differences between the weighted respondents’ estimate and the full sample. This would indicate the weights lessened the risk for bias.

Program participation. We conducted nonresponse bias analyses for program participation in fall 2021 by comparing the participating programs with the full sample (that is, participating and nonparticipating programs; see Exhibit II.1). We found some differences between participating programs and the full sample that were not resolved or mitigated by the analysis weight and were large enough to conclude there may be remaining indicators of nonresponse bias after weighting. As program-level participation is a building block for other weights, any remaining indicators of nonresponse bias could carry through to child estimates.

Survey response. We also conducted nonresponse bias analyses at the child-level for response to the spring 2022 surveys. For parent survey response, there do not appear to be remaining indicators of meaningful nonresponse bias after weighting. For weights attempting to account for combined response to both the parent survey and the TCR, some differences between respondents and nonrespondents were large enough to conclude there may be remaining indicators of nonresponse bias after weighting. There may be other characteristics that we were not able to test that could also indicate nonresponse bias after weighting. We do not know if the weights mitigated the likelihood of bias for those variables that we could not test because data was not available for nonrespondents.

Detailed information on nonresponse and the nonresponse bias analyses is in the 2021–2022 Study User’s Manual (M. Reid et al. 2024).

C. Weighting for sample selection and nonresponse

We use four weights at the child/family level depending on data included in the tables:

- For tables that include estimates using only data from the parent survey, we apply a weight to the children whose parent completed a fall *or* spring survey.⁹
- For tables that include estimates of change from fall to spring using only data from the parent survey, we apply a longitudinal weight to the children whose parent completed a fall *and* spring survey.¹⁰
- For tables that include estimates using data from both the parent survey and the TCR, we apply a weight to the children whose parent completed their survey in the fall *or* spring *and* whose teacher completed the TCR in the spring.¹¹
- For tables that include estimates of change from fall to spring using data from both the parent survey and the TCR, we apply a longitudinal weight to the children whose parent completed their survey in the fall *or* spring and whose teacher completed the TCR in the fall *and* spring.¹²

The data are weighted to adjust for the probability of selection. To the extent possible, they also account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, **because the response rates were lower than expected, readers should not assume the data are nationally representative of children and families enrolled in Head Start programs in the 2021–2022 program year. For the same reason, data are not comparable to data from other FACES studies and should not be used as evidence of national trends in the Head Start population (see M. Reid et al. 2024 for more information).**

Further, readers should use caution when interpreting weighted data from the TCR, as the associated weights had remaining indicators of nonresponse bias for those covariates that were tested.

D. Precision of estimates

Standard errors provide information on the precision of estimates. A larger standard error signifies a wider confidence interval around the estimate. For example, a 95 percent confidence

⁹ This weight adjusts for parents who completed neither the fall nor spring survey.

¹⁰ This weight adjusts for parents who did not complete both the fall and spring surveys.

¹¹ This weight adjusts for parents who completed neither the fall nor spring survey or whose teachers did not complete the spring TCR.

¹² This weight adjusts for parents who completed neither the fall nor spring survey or whose teachers completed neither the fall nor spring TCR.

interval means that we can be 95 percent sure that the range of values included in the confidence interval contains the true mean or percentage of the population, based on our sample design.

The tables in this report include unweighted sample sizes which, along with standard errors, give a sense of the precision of the estimates in the 2021–2022 Study. A precise estimate is one that is close to the true value of the population. Tables include a notation indicating estimates with low precision, which is defined as an estimate in which the standard error represents more than 30 percent of the estimate and indicates that the true population value could have a large range of actual values (National Center for Health Statistics 2015). Therefore, readers should interpret estimates with low precision with caution because they are unreliable. For each table of sample estimates (Tables A–C), we also provide accompanying standard error tables (Tables AA–CC) based on the weighted estimates.

E. Questions with “other” response options

Some survey questions gave parents and teachers the option of filling in text boxes (labeled “Other”) if the listed survey responses did not accurately or fully capture their experiences. For example, when asked about strategies they used to meet child care needs outside of their regular child care arrangements, parents could fill in their own response if none of the provided response options adequately captured their experience. Before analyzing the data, we determined whether we could code these “other” responses into any of the existing response options, or whether we had enough similar responses to create a new response category. In the tables, we present responses to the “Other” questions as “Another _____,” (specifying the general category of responses in the blank, such as “Another reason” or “Another strategy”) and provide examples of these responses in table footnotes as available.

F. Questions with “select all that apply” response options

Some questions allowed parents to select all response options (or in some cases, up to a certain number of response options) that applied to a question. For example, when asked about the reasons they decided to enroll their child in Head Start, parents could select all response options that applied from the following list: to help prepare their child for kindergarten; close to child’s home; free of cost; friends, neighbors, or family members had also sent their child; provides hours that fit parent’s schedule; or offers additional services for child and family. Because they could select as many responses as applied, percentages may not sum to 100 percent. We identified these types of survey questions in the tables with a footnote on the specific item. If we did not include this footnote, respondents could select only one response option.

G. Fall–spring change analyses

We surveyed some parents and teachers in both fall 2021 and spring 2022, which allowed us to ask key questions of those respondents at both time points and to test whether there were differences between responses in fall and in spring. We examined fall-spring change across all children and separately for child’s previous Head Start experience (newly entering Head Start versus returning for a second year, and newly entering 3-year-olds versus newly entering 4-year-olds) and by child age (3-year-olds versus 4-year-olds). To examine whether fall estimates differed significantly from spring estimates, we conducted ordinal regressions (for ordinal

variables) and linear regressions (for binary variables and for continuous variables) to examine whether mean values or percentages differed between fall and spring. We report whether the differences are statistically significant at the $p \leq .05$ level, using chi-squared tests for ordinal (that is, categorical) variables and t-tests for binary and continuous variables. Some differences, although statistically significant, are very small and may not always be practically meaningful.¹³ When conducting multiple tests of statistical significance, it is possible that some differences may be statistically significant by chance. We did not adjust analyses for this possibility.

H. Subgroup analyses and sample size suppression

We present some tables by previous Head Start experience (newly entering Head Start versus returning for a second year, and newly entering 3-year-olds versus newly entering 4-year-olds) and by child age (3-year-olds versus 4-year-olds). We did not statistically examine whether characteristics were significantly different across subgroup categories. Instead, we present descriptive findings by these subgroups. Sample sizes (and, in particular, of the subgroups) may be small depending upon the type of survey respondent, size of the subgroup, and what variables we used. Estimates with smaller sample sizes may be less reliable than estimates with larger sample sizes. To ensure the precision of the estimates and protect the confidentiality of study respondents, we do not report estimates based on fewer than 10 responses (that is, the unweighted sample size must be 10 or greater) and add a note to tables where we suppressed (that is, do not report) the estimates. We collapsed categories whenever possible to limit the number of estimates that could not be reported.

¹³ For example, children's hyperactive behavior subscale score for children returning to Head Start in fall 2021 was 1.4 and in spring 2022 was 1.5, and the difference was statistically significant (Table B.7). Hyperactive behavior has a range of 0 to 6 and a standard deviation of 1.70. So while there was a statistically significant increase in hyperactive behavior score from fall 2021 to spring 2022, a change of 0.1 may not indicate a practically meaningful change in behavior given the change is a small proportion of the total range and of a standard deviation.

This page has been left blank for double-sided copying.

IV. OVERVIEW OF COMPOSITE VARIABLES AND SCORES FOR HEAD START CHILDREN AND FAMILIES

In this section, we discuss how we measured the constructs of interest. We give details about composites, which are characteristics constructed from more than one survey item, and details about scores, which are calculated by adding or averaging the item values in an assessment or scale. We also include variables that are recoded from a single variable.

An example of a composite is *who is living in child's household*. This composite uses data from two items from the parent survey: the people living in the child's house and the relationship of each member of the household to the child. Together, these two items make up the composite that indicates who is living in the child's household.

Composites may be calculated from survey questions that were asked in one of three ways: (1) in the spring only, (2) in both fall and spring, or (3) in the fall or spring, depending on when the respondent completed their first survey (which could have been in fall 2021 or spring 2022). We indicate the study wave (fall 2021 and/or spring 2022) that we used to calculate composites derived from parent survey or TCR data in the source note of the data table.

More information about how we constructed variables and handled missing data can be found in the 2021–2022 Study User's Manual (M. Reid et al. 2024).

A. Children's characteristics, family background, and the home environment

Parents reported on characteristics of their households (such as income and languages spoken in the home), the household members (including their relationship to the child in the sample), their own symptoms of depression (if any), their social supports, and their ratings of their children's health status, among other subjects.¹⁴

We created composites to describe child and family characteristics. We also created composites to define subgroups used in analysis, such as children's previous Head Start experience. The composites describing the child's gender, race/ethnicity, age, the language that is always or usually spoken to the child in the home, parents' marital status, highest level of education of parent(s), highest level of education of mother(s) and father(s), employment status of parent(s), and employment status of mother(s) and father(s) are based on fall 2021 data, and in some instances, spring 2022 data (if fall data are missing).¹⁵ We describe how we created these composites below.

¹⁴ For simplicity, we use the term "parents" throughout this report to represent the child's primary caregiver who completed the parent survey. In the 2021–2022 Study's sample, 90.5 percent of respondents to the parent survey were biological or adoptive parents for the child. The remaining 9.5 percent of respondents to the parent survey were other primary caregivers, such as grandparents. These statistics are weighted percentages.

¹⁵ For example, we asked parents the language they usually spoke in the home in fall 2021. For parents who did not complete a fall survey but completed a spring 2022 survey, we asked this question in the spring. If parents completed a fall survey, they were not shown this question again in the spring.

Previous Head Start experience identifies the percentage of children who were newly entering Head Start versus those who were returning for a second year in fall 2021. Information comes from Head Start programs (the child’s date of birth and the date the child first enrolled in any Head Start program). We include tables that break out the data by previous Head Start experience, and some tables for newly entering children by age. Because only 12 percent of the children in the sample were returning for a second year in fall 2021, we do not report information on them separately by age in the tables; 73 percent of children who were returning for a second year in fall 2021 were age 4 or older.

Child race/ethnicity is constructed from two questions. The first question asks parents whether the child belongs to one or more race categories. The second asks whether the child is of Spanish, Hispanic, Latino/a/x, or Chicano/a/x origin. If the parent indicated that the child’s ethnicity was Spanish, Hispanic, Latino/a/x, or Chicano/a/x, then we categorized the child as Hispanic, Latino/a/x, or Chicano/a/x regardless of the race categories they selected. If the parent indicated that the child was not Spanish, Hispanic, Latino/a/x, or Chicano/a/x, then we used the one or more race categories they selected to categorize them as follows: White, non-Hispanic; Black, non-Hispanic; American Indian or Alaska Native, non-Hispanic; Asian or Pacific Islander, non-Hispanic; multiracial/biracial, non-Hispanic; and another race, non-Hispanic. The survey question was asked once, in the parent’s first survey, which could have been fall 2021 or spring 2022.

Language that is always or usually spoken to the child in the home is constructed from parents’ report of the language they always or usually use with the child at home. If parents reported speaking only one language in the home, we considered that to be the one they always spoke to the child. If they reported using more than one language in the home, we asked which one they used most often when speaking to the child. Categories include English, Spanish, and another (non-Spanish) language. The survey question was asked once, in the parent’s first survey, which could have been fall 2021 or spring 2022.

Child’s primary caregiver(s) is constructed from parents’ reports of the people who live in the household, with each adult household member’s relationship to the child. The six categories are the child living with two biological or adoptive parents; living with one biological or adoptive parent; living with one biological or adoptive parent and one nonbiological or nonadoptive parent; living with two nonbiological or nonadoptive parents; living with biological or adoptive grandparent(s) without parents; and living with another primary caregiver. These categories focus on biological or adoptive parents and do not include other adults, such as parents’ romantic partners or foster parents. Thus, for example, the “one biological or adoptive parent” category indicates the biological or adoptive parent is the only biological or adoptive parent in the household; it does not necessarily mean the parent is the only adult in the household. The survey question was asked once, in the parent’s first survey, which could have been fall 2021 or spring 2022.

We show marital status in two ways:

1. *Marital status of all households* includes households in which the child’s primary caregiver may not be a biological or adoptive parent, or in which the child lives with only one biological or adoptive parent. Marital status categories include married, registered domestic

partnership or civil union, and unmarried. The survey question was asked once, in the parent's first survey, which could have been fall 2021 or spring 2022.

2. *Marital status of two-parent households* includes households in which children live with their biological or adoptive mother and biological or adoptive father. Marital status categories include married, registered domestic partnership or civil union, and unmarried. The survey question was asked once, in the parent's first survey, which could have been fall 2021 or spring 2022.

Highest level of education of parent(s) in the household is constructed from parents' report of who lives in the household and the highest level of education. Categories include less than a high school diploma; high school diploma or GED; some college and/or a vocational, technical, or associate's degree; and bachelor's degree or higher. Children in one- or two-parent households with biological or adoptive parents are included in this construct; we exclude the 9.5 percent of children whose households do not include a biological or adoptive parent. This construct includes children with one or with two biological or adoptive parents; when there are two parents, it indicates the highest education level between them. For example, if a child lives in a two-parent household where one parent has a high school diploma and the other parent has a bachelor's degree, the child would be included in the "bachelor's degree or higher" category. The survey question was asked once, in the parent's first survey, which could have been fall 2021 or spring 2022.

Highest level of education of mother(s) and father(s) in the household is constructed from parents' report of who lives in the household and their highest level of education. Children in one- or two-parent households with biological or adoptive parents are included in this construct; we exclude the 9.5 percent of children whose households do not include a biological or adoptive parent. Children are included in either the mother or father category if they have a mother or father in the household, respectively. The survey question was asked once, in the parent's first survey, which could have been fall 2021 or spring 2022.

Employment status of parent(s) in the household is constructed from parents' report of who lives in the household and their current employment status. Categories include two parents working full time, single parent working full time, one parent working full time and one parent working part time or less, two parents working full time or less, and single parent working part time or less. Children in one- or two-parent households with biological or adoptive parents are included in this construct; we exclude the 9.5 percent of children whose households do not include a biological or adoptive parent. The survey question was asked once, in the parent's first survey, which could have been fall 2021 or spring 2022.

Employment status of mother(s) and father(s) in the household is constructed from parents' report of who lives in the household and their current employment status. We only asked for the employment status of parents who live with the child. Categories include working full time, working part time, looking for work, and not in the labor force. Children in one- or two-parent households with biological or adoptive parents are included in this construct; we exclude the 9.5 percent of children whose households do not include a biological or adoptive parent. Children are included in either the mother or father category if they have a mother or father in the household, respectively. The survey question was asked once, in the parent's first survey, which could have been fall 2021 or spring 2022.

All potential sources of income supporting the household, calculated as a percentage of federal poverty threshold, uses 2020 thresholds set by the U.S. Census Bureau. These are determined by annual household income compared to the number of family members. In 2020, 100 percent of the federal poverty threshold for a family of four was \$26,496. The survey questions were asked of all parents in both fall 2021 and spring 2022.

We also report *annual household income*, which includes all contributions from members of the household, safety net programs, and other sources of income such as rental income, interest, and dividends.¹⁶ It does not include stimulus payments from the government. Additionally, household income is not used to determine eligibility for Head Start. Head Start qualifying criteria use family (not household) income, and there are other (non-income) ways to qualify for the program. The survey questions were asked of all parents in both fall 2021 and spring 2022.

Parents' depressive symptoms are from the short form of the Center for Epidemiological Studies Depression (CES–D) Scale (Ross et al. 1983). Parents reported how often each item in a list of 12 statements applied to them in the past week using a 4-point scale: (1) rarely or never, (2) some or a little of the time, (3) occasionally or a moderate amount of time, and (4) most or all of the time. Responses of rarely or never are recoded as 0; some or a little are recoded as 1; occasionally or moderately are recoded as 2; and most or all of the time are recoded as 3. Scores of the recoded items were summed for a possible range of 0 to 36. Total depressive symptoms scores are categorized as no to few (0 to 4), mild depressive symptoms (5 to 9), moderate depressive symptoms (10 to 14), and severe depressive symptoms (15 and above). The CES–D is a screening tool, not a diagnostic tool, but scores have been correlated with clinical diagnosis (Radloff 1977). The survey questions were asked of all parents in both fall 2021 and spring 2022.

Parents' anxiety symptoms are from the Generalized Anxiety Disorder seven-item (GAD–7) scale (Spitzer et al. 2006). Parents reported how often each item in a list of seven statements applied to them over the past two weeks using a 4-point scale: (1) not at all, (2) several days, (3) more than half the days, and (4) nearly every day. Responses of not at all are recoded as 0; several days are recoded as 1; more than half the days recoded as 2; and nearly every day are recoded as 3. Scores of the recoded items were summed for a possible range of 0 to 21. Total anxiety symptoms scores are categorized as no to minimal anxiety symptoms (0 to 4), mild anxiety symptoms (5 to 9), moderate anxiety symptoms (10 to 14), and severe anxiety symptoms (15 and above). The GAD–7 is a screening tool, not a diagnostic tool, but scores have been correlated with clinical diagnosis (Plummer et al. 2016). The survey questions were asked of all parents in both fall 2021 and spring 2022.

Parenting behaviors and stress is constructed using six items in the parent survey that come from the Healthy Families Parenting Inventory (Krysiak and LeCroy 2012): (1) has a plan for child's behavior management; (2) child frustrates them; (3) feels confident in their parenting; (4) parenting involves more work than they are able to manage; (5) feels that they are meeting their child's needs; and (6) has time enough to relax, think, and plan. Ratings are on a 5-point scale: (1) rarely or never, (2) a little of the time, (3) some of the time, (4) a good part of the time, and

¹⁶ When household income could not be constructed because of out-of-range or missing values, we imputed a continuous income variable. Imputation is a statistical procedure that allows us to use nonmissing data to estimate what the missing value is likely to be.

(5) always or most of the time. Some items are reverse coded so that higher scores indicate more stress related to parenting. *Parenting behaviors and stress* is a mean score and has a possible range of 1 to 5. The survey questions were asked of all parents in both fall 2021 and spring 2022.

Parenting relationship warmth score is constructed using six items from the parent survey: parent and child have warm, close times together; most of the time the parent feels that the child likes and wants to be near them; even when the parent is in a bad mood, they show the child a lot of love; parent expresses affection by hugging, kissing, and holding the child; the child does things that really bother the parent; and the parent often feels angry with the child. Ratings are on a 4-point scale ranging from not true at all to completely true. Some items are reverse coded to make the scale direction consistent, meaning negatively-worded items (where lower values indicate greater relationship warmth) are coded in a positive direction (so that higher values indicate greater relationship warmth). The parenting relationship warmth score is a mean score and has a possible range of 1 to 4; higher scores indicate greater relationship warmth in the parent–child relationship. These questions come from the Early Childhood Longitudinal Survey (ECLS) 2020 Field Test Preschool Parent Survey for the ECLS-Kindergarten 2023 Study. The survey questions were asked of all parents in both fall 2021 and spring 2022.

Number of strategies the parent used to meet child care needs is constructed using five items from the parent survey: family or friends sometimes provide child care, they or another guardian reduces work hours, they or another guardian works different hours than usual, older siblings sometimes provide child care, or they or another guardian takes child to work. This variable has a possible range of 0 to 5, where lower scores represent fewer strategies used to meet child care needs. The survey questions were asked of all parents in both fall 2021 and spring 2022.

Findings on these topics are reported in [Section A](#).

B. Children’s social-emotional and learning skills

We used data from the TCR and parent survey to get multiple perspectives on children’s positive behavior and challenging behavior that could affect their ability to learn and interact with children of the same age and with adults. Because of the COVID-19 pandemic, we did not collect direct assessments (and assessor ratings) of children’s behaviors in the classroom, which past FACES studies have collected.

Lead teachers reported on children’s cooperative classroom behavior or social skills (for example, following the teacher’s directions or complimenting classmates) and on their problem behaviors (for example, hits or fights with others) in the classroom using items taken from the Behavior Problems Index (Peterson and Zill 1986), the Personal Maturity Scale (Entwisle et al. 1997), and the Social Skills Rating Scale (Gresham and Elliott 1990). Teachers reported on children’s literacy skills (for example, recognizing letters) by using adapted items from the National Household Education Survey. Lead teachers and parents also rated children’s approaches to learning (children’s motivation, attention, organization, persistence, and independence in learning) by using the Early Childhood Longitudinal Study, Kindergarten Class of 1998–99 Approaches to Learning Scale (ECLS–K; National Center for Education Statistics 2002). These scores are based on teachers’ and parents’ ratings of children; all scores are

indicators of absolute performance, not performance compared to other children. The survey questions were asked of all parents and teachers in both fall 2021 and spring 2022.

- *Social skills score* is a sum of 12 items with a total of 24 possible points, all related to children’s cooperative behavior and social skills. The items come from the Personal Maturity Scale and the Social Skills Rating Scale. Higher scores indicate the child exhibits cooperative behavior more frequently. The lead teacher reports this score.
- *Problem behaviors total score* is a sum of 14 items that contains three subscale scores— Aggressive Behavior (four items), Withdrawn Behavior (six items), and Hyperactive Behavior (three items).¹⁷ The items come from an abbreviated adaptation of the Personal Maturity Scale and from the Behavior Problems Index. Higher scores indicate the child exhibits negative behavior more frequently. The lead teacher reports this score.
- *Literacy skills score* is a sum of five items that ranges from 0 to 7. These items are adapted from the National Household Education Survey. Higher scores indicate the child exhibits literacy skills more frequently. The lead teacher reports this score.
- *Approaches to learning score* is a mean (average) of six items that make up the Approaches to Learning Scale from the ECLS–K. Higher scores indicate the child exhibits positive approaches to learning behaviors more frequently. This score is reported both by lead teachers and parents.¹⁸

Lead teachers also report on children’s *math knowledge and skills* (for example, counting ability and sorting ability). The survey questions were asked of all teachers in both fall 2021 and spring 2022.

Findings on these topics and scores are reported in [Section B](#).

C. Children’s physical health and disability status

The 2021–2022 Study measured children’s physical health and disability status in several ways. Lead teachers reported on aspects of children’s disability status and developmental conditions or concerns. For children with a teacher-reported disability, lead teachers reported on the type(s) of disability and whether the child had an Individualized Education Program (IEP) or Individual Family Service Plan (IFSP). The survey questions were asked of all teachers in both fall 2021 and spring 2022. Among children who had an IEP or IFSP, lead teachers reported on children’s receipt of services and how services were delivered. Parents rated their child’s overall health status. This survey question was asked of all teachers in spring 2022 only.

Findings on these topics and composites are reported in [Section C](#).

¹⁷ The number of items in the three subscales add up to 13. One item that was not included in the subscales is included in the total score for problem behaviors. Therefore, the total score for problem behaviors accounts for 14 items.

¹⁸ Parents answered questions using language adapted to be more appropriate for the home environment (rather than the school environment in which teachers observe children). See the 2021–2022 Study User’s Manual (M. Reid et al. 2024) for details.

SECTION A

CHILDREN'S CHARACTERISTICS, FAMILY BACKGROUND, AND HOME ENVIRONMENT

Return to description of [Section A](#) topics and composites.

This page has been left blank for double-sided copying.

Table A.1. Children’s demographic characteristics

	Unweighted total sample size (n)	Weighted percentage
Previous Head Start experience	1,159	
Newly entering children		88.0
Returning children		12.0
Age as of September 1, 2021	1,158	
3 years old or younger		52.5
4 years old or older		47.5
Race/ethnicity	1,156	
White, non-Hispanic		31.8
Black, non-Hispanic		27.9
Hispanic, Latino/a/x, or Chicano/a/x		26.3
American Indian or Alaska Native, non-Hispanic		7.8
Asian or Pacific Islander, non-Hispanic		4.5 [^]
Multiracial/biracial, non-Hispanic		1.2 [^]
Another race, non-Hispanic ^a		0.5 [^]
Gender^b	1,158	
Boy		50.3
Girl		49.9
Prefer not to answer		0.1 [^]
Another gender identity		0.0
Participated in Early Head Start	932	
Yes		17.5
No		82.5

Source: Fall 2021 and Spring 2022 Parent Survey and Survey Management System.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^a“Another race, non-Hispanic” includes respondents who did not fit into a category included in the table. These races/ethnicities were categorized as “Another race, non-Hispanic” due to the small number of respondents.

^bRespondents could select all gender identities that applied.

Table A.2. Children’s demographic characteristics, by previous Head Start experience

	All newly entering children		All returning children	
	Unweighted total sample size (n)	Weighted percentage	Unweighted total sample size (n)	Weighted percentage
Age as of September 1, 2021	975		183	
3 years old or younger		56.0		26.8
4 years old or older		44.0		73.2
Race/ethnicity	974		182	
White, non-Hispanic		31.7		32.4
Black, non-Hispanic		28.1		26.5 [^]
Hispanic, Latino/a/x, or Chicano/a/x		25.4		33.3
American Indian or Alaska Native, non-Hispanic		7.9		7.1 [^]
Asian or Pacific Islander, non-Hispanic		5.1 [^]		0.0
Multiracial/biracial, non-Hispanic		1.3 [^]		0.3 [^]
Another race, non-Hispanic ^a		0.5 [^]		0.4 [^]
Gender^b	975		183	
Boy		50.2		51.5
Girl		49.9		50.1
Prefer not to answer		0.1 [^]		0.0
Another gender identity		0.0		0.0
Participated in Early Head Start	773		159	
Yes		16.1		26.8
No		83.9		73.2

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children.

Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aAge as of September 1, 2021.

^b“Another race, non-Hispanic” includes respondents who did not fit into a category included in the table. These races/ethnicities were categorized as “Another race, non-Hispanic” due to the small number of respondents.

^cRespondents could select all gender identities that applied.

Table A.4. Languages spoken in the home and the language always or usually spoken to the child in the home

	Unweighted total sample size (n)	Weighted percentage
All languages spoken in the home^a	1,147	
English		91.3
Spanish		26.4
Another language ^b		12.4 [^]
Language that is always or usually spoken to the child in the home^c	1,150	
English		79.4
Spanish		14.6
Another language ^b		6.1 [^]
Language that is always or usually spoken to the child in the home is used for classroom instruction^d	786	
Yes		85.4
No		14.6 [^]

Source: Fall 2021 and Spring 2022 Parent Survey and Spring 2022 Teacher Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample size to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children. The unweighted sample size for match between home and classroom language is lower because that construct requires a child to have an associated Fall 2021 or Spring 2022 Parent Survey, and a completed Spring 2022 Teacher Survey.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aThe study based this on the parent’s report of languages spoken in the home; respondents could select all languages that the family speaks.

^b“Another language” includes examples of non-Spanish languages such as Farsi and Portuguese. These languages were categorized as “Another language” due to the small number of respondents.

^cParents could report using more than one language in the home. If they reported using only one language in the home, we considered that to be the language always spoken to the child in the home. If parents reported using more than one language in the home, we asked about and used the language that is usually spoken to the child.

^dThe study based this on the lead teacher’s report of the language(s) used for instruction in the classroom, as well as the parent’s report of the language that is always or usually spoken to the child at home. More information on the Spring 2022 Teacher Survey is available in N. Reid et al. (2024).

Table A.5. Child’s primary caregiver, parent marital status, and who was living in the child’s household^a

	Unweighted total sample size (n)	Weighted percentage	
Child’s primary caregiver	926		
One biological or adoptive parent		58.0	
Two biological or adoptive parents		29.8	
One biological or adoptive parent and one non-biological or non-adoptive parent		2.8	
Biological or adoptive grandparent(s) without parents		2.2 [^]	
Two non-biological or non-adoptive parents		0.0	
Another primary caregiver ^b		7.2	
Marital status of two-parent households	376		
Married		71.5	
Unmarried		23.6	
Registered domestic partnership or civil union		4.9	
Marital status of all households	842		
Married		37.6	
Unmarried		60.0	
Registered domestic partnership or civil union		2.3	
Child was living with temporary household members^c	924		
Yes		3.5	
No		96.5	
Child was living with grandparent and/or great grandparent^d	927		
Yes, with parent(s) in the household		6.4	
Yes, without parent(s) in the household		2.6	
No		91.1	
	Unweighted total sample size (n)	Weighted mean	Reported range
Number of people in household^e	928	2.6	2-6

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children. Some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aThis table focuses on biological or adoptive caregivers and does not include other adults, such as parents’ romantic partners or foster parents. Thus, for example, the “One biological or adoptive parent” category indicates that the biological or adoptive parent is the only biological or adoptive parent in the household; it does not mean the parent is the only adult in the household.

Table A.5 (*continued*)

^b“Another primary caregiver” includes examples such as stepparent without a biological parent and households with more than two parents. These caregivers were categorized as “Another primary caregiver” due to the small number of respondents.

^c“Temporary household members” include someone who usually lives somewhere else but is staying in the household for the time being.

^dThis category includes children living with and without their biological or adoptive parent(s).

^e“Number of people” includes anyone who normally lives in the household with the child (including relatives and non-relatives).

Table A.6. Level of education parents completed^a

	Unweighted total sample size (n)	Weighted percentage
Highest level of education of parent(s) in the household^b	1,094	
Less than high school diploma		13.4
High school diploma or GED		35.2
Some college/vocational/technical/Associate degree		36.5
Bachelor’s degree or higher		14.9
Level of education of mother(s) in the household^c	1,068	
Less than high school diploma		15.5
High school diploma or GED		38.6
Some college/vocational/technical/Associate degree		33.9
Bachelor’s degree or higher		11.9
Level of education of father(s) in the household^d	413	
Less than high school diploma		18.7
High school diploma or GED		36.8
Some college/vocational/technical/Associate degree		29.3
Bachelor’s degree or higher		15.2

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aData include households with at least one biological or adoptive parent. We exclude the 4.5 percent of children whose households do not include a biological or adoptive parent.

^b“Highest level of education of parent(s) in the household” includes children with one or two biological or adoptive parents in the household and the highest education level among them when there are two parents. If there is only one parent, the “highest level of education of parent(s) in the household” reflects that parent.

^c“Level of education of mother(s) in the household” includes children with a biological or adoptive mother in the household, whether alone or with another parent, and all mothers in households.

^d“Level of education of father(s) in the household” includes children with biological or adoptive a father in the household, whether alone or with another parent, and all fathers in households.

Table A.7. Parent’s employment status^a

	Unweighted total sample size (n)	Weighted percentage
Employment status of parent(s) in the household^b	1,041	
Two parents working full time		7.3
Single parent working full time		23.6
One parent working full time; one parent working part time or less		21.9
Two parents working part time or less		8.1
Single parent working part time or less		39.1
Employment status of mother(s) in the household^c	1,077	
Full-time		32.6
Part-time		25.9
Looking for work		9.2
Not in labor force		32.3
Employment status of father(s) in the household^d	447	
Full-time		71.5
Part-time		14.3
Looking for work		4.5 [^]
Not in labor force		9.6

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aData include households with at least one biological or adoptive parent. We exclude the 4.5 percent of children whose households do not include a biological or adoptive parent.

^b“Employment status of parent(s) in the household” includes children with one or two biological or adoptive parents in the household and the highest employment level among them when there are two parents. If there is only one parent, the “employment status of parent(s) in the household” reflects that parent.

^c“Employment status of mother(s) in the household” includes children with a mother in the household, whether alone or with another parent. Percentages may sum to more than 100 because there are households with more than one biological or adoptive mother.

^d“Employment status of father(s) in the household” includes children with a father in the household, whether alone or with another parent. Percentages may sum to more than 100 percent because there are households with more than one biological or adoptive father.

Table A.8. Total household income in the past 12 months^a

	Unweighted total sample size (n)	Weighted percentage
Annual household income (categories)	928	
<\$10,000		13.6
\$10,001 - \$20,000		22.1
\$20,001 - \$30,000		20.3
\$30,001 - \$40,000		19.7
\$40,001 - \$50,000		8.1
>\$50,000		16.2

	Unweighted total sample size (n)	Weighted mean	Reported range
Annual household income^b	928	\$29,965	\$3,600-75,000

Source: Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aThis table summarizes household income. Readers should not use it to estimate eligibility for Head Start. Head Start qualifying criteria use family (not household) income. There are also other (non-income) ways to qualify for the program. Household income reported in this table includes all contributions from members of the household, safety net programs, and other sources of income such as rental income, interest, and dividends. This does not include stimulus payments from the government.

^bTo lessen the effect of a small number of respondents who reported annual incomes higher than \$75,000, we limit the annual household income at a maximum of \$75,000.

Table A.9. Total household income in the past 12 months: Change from fall 2021 to spring 2022^a

	Unweighted total sample size (n)	Fall 2021	Spring 2022	Fall-spring change ^{b,c}
		Weighted percentage	Weighted percentage	Weighted percentage point difference
Annual household income categories	504			
<\$10,000		19.3	13.3	-6.0
\$10,001-\$20,000		18.9	26.0	7.1
\$20,001-\$30,000		25.3	19.0	-6.3
\$30,001-\$40,000		16.9	18.2	1.3
\$40,001-\$50,000		6.7	8.6	1.9
>\$50,000		12.9	14.9	2.1
				Weighted mean difference (reported range^e)
Annual household income^d	504	\$26,427 (\$1,200-75,000)	\$28,685 (\$3,600-75,000)	\$2,259 (-\$71,400-63,000)*

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 505 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aThis table summarizes household income. Readers should not use it to estimate eligibility for Head Start. Head Start qualifying criteria use family (not household) income. There are also other (non-income) ways to qualify for the program. Household income reported in this table includes all contributions from members of the household, safety net programs, and other sources of income such as rental income, interest, and dividends. This does not include stimulus payments from the government.

^bAsterisk (*) indicates if there is a statistically significant fall-spring change in the distribution of responses at the $p \leq .05$ level.

^cA negative value for fall-spring change means a decrease in income from fall to spring.

^dTo lessen the effect of a small number of respondents who reported annual incomes higher than \$75,000, we limit the annual household income at a maximum of \$75,000.

^eThe change in scores between fall 2021 and spring 2022 were outliers for 11 parents, meaning the difference in their responses between fall and spring was more than three standard deviations different from the average fall-spring change. This represents 2.2 percent of the sample. These outliers are included in the table and account for the large reported ranges for fall-spring change.

Table A.10. Total household income in the past 12 months, as a percentage of the federal poverty threshold^{a,b}

	Weighted percentage (unweighted n = 927)
Below 50 percent	13.3
50 to 100 percent	19.9
101 to 130 percent	11.9
131 to 185 percent	23.9
186 to 200 percent	5.3
201 percent or above	25.7

Source: Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The unweighted sample size identifies the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aThis table summarizes household income. Readers should not use it to estimate eligibility for Head Start. Head Start qualifying criteria use family (not household) income. There are also other (non-income) ways to qualify for the program. Household income reported in this table includes all contributions from members of the household, safety net programs, and other sources of income such as rental income, interest, and dividends. This does not include stimulus payments from the government.

^bThe federal poverty threshold used in this table is based on 2020 thresholds set by the U.S. Census Bureau, which use household income relative to number of family members. For example, 100 percent of the federal poverty threshold for a family of four in 2020 was \$26,496.

Table A.11. Whether families shared housing or moved in the last 12 months and why

	Unweighted total sample size (n)	Weighted percentage
Housing situation^a	924	
Family lives in shared housing, transitional housing or apartment, or homeless shelter		7.6
Family does not live in shared housing, transitional housing or apartment, or homeless shelter		90.9
Family has another housing situation ^b		1.5 [^]
Number of moves in the last 12 months	928	
None		86.7
One		11.8
Two		0.6 [^]
Three or more		0.9 [^]
Among families that moved at least once in the last 12 months, the main reason for the most recent move	134	
For a job or schooling		28.3
Could not afford prior home		11.1 [^]
To be closer to family or friends		6.9 [^]
To lower living expenses		6.5 [^]
Escape domestic abuse		5.6 [^]
Moved in with partner or spouse		4.6 [^]
Prior landlord sold housing		4.1 [^]
Housing was destroyed		4.5 [^]
Was evicted		1.7 [^]
Safer community		1.0 [^]
Family or friends no longer willing to house them		1.0 [^]
Time limit up for transitional housing		1.0 [^]
More space		0.3 [^]
Another reason ^c		23.5

Source: Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children. Some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

Spring 2022 data were collected from April 2022 through July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aThese responses were mutually exclusive; respondents were only able to select one of the three response options.

^b“Another housing situation” includes examples such as living in a camper or mobile home.

^c“Another reason” includes examples such as divorce or becoming a homeowner. These reasons were categorized as “Another reason” due to the small number of respondents.

Table A.12. Parents' feelings about their housing conditions

	Unweighted total sample size (n)	Weighted percentage
Housing is just the right size	1,152	
Strongly disagree		8.4
Disagree		13.9
Neutral		16.4
Agree		38.5
Strongly agree		22.8
Housing is crowded	1,152	
Strongly disagree		23.8
Disagree		41.3
Neutral		16.0
Agree		13.9
Strongly agree		5.0
Housing needs major repairs	1,153	
Strongly disagree		20.3
Disagree		45.2
Neutral		16.6
Agree		13.1
Strongly agree		4.9
Housing is old and aged	1,151	
Strongly disagree		17.2
Disagree		35.8
Neutral		21.1
Agree		18.0
Strongly agree		7.9
Housing is kept in good condition	1,154	
Strongly disagree		2.4 [^]
Disagree		5.1
Neutral		14.2
Agree		52.2
Strongly agree		26.1

Source: Spring 2022 Parent Survey.

Table A.17 (continued)

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^a Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^a“Parenting behaviors and stress” takes the mean of the six items shown in the top of the table. Higher scores indicate more parenting stress. Four of the six items were reverse coded, specifically, “Parent has a plan for their child or children’s behavior management,” “Parent feels confident in their parenting,” “Parent feels that they are meeting their child or children’s needs,” and “Parent has time to themselves to relax, think, plan.” That is, we changed the low score values to high score values and high score values to low score values of these four items to align with higher scores indicating more frequency of stress.

^bThe possible range is 1 to 5 and reflects the range in the mean rating of the six items.

Table A.18. Parenting stress and behaviors: Change from fall 2021 to spring 2022

		Fall 2021	Spring 2022	Fall-spring change ^{a,b}

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to a limited extent, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 505 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aAsterisk (*) indicates if there is a statistically significant fall-spring change in the distributions of responses at the $p \leq .05$ level. There was not a statistically significant fall-spring change in the distribution of responses in this table.

^bA negative value for fall-spring change means a decrease in score from fall to spring.

^c“Parenting behaviors and stress” reflects the mean of the six items shown in the top of the table. The possible range is 1 to 5. Higher scores indicate more parenting stress. Four of the six items were reverse coded, specifically, “Parent has a plan for their child or children’s behavior management,” “Parent feels confident in their parenting,” “Parent feels that they are meeting their child or children’s needs,” and “Parent has time to themselves to relax, think, plan.” That is, we changed the low score values to high score values and high score values to low score values of these four items to align with higher scores indicating more frequency of stress.

^dThe change in scores between fall 2021 and spring 2022 were outliers for 3 parents, meaning the difference in their responses between fall and spring was more than three standard deviations different from the average fall-spring change. This represents less than 1 percent of the sample. These outliers are included in the table and account for the large reported ranges for fall-spring change.

Table A.19. Parents' health status

Table A.26 (*continued*)

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aThis measure is from the Early Childhood Longitudinal Survey (ECLS) 2020 Field Test Preschool Parent Survey for the ECLS-Kindergarten 2023 Study.

^b“Parenting relationship warmth score” is the average of six items that measure the extent to which statements about the parent’s relationship with the child are not true at all, somewhat true, mostly true, or completely true. Negatively worded items were reverse coded prior to calculating the average.

^cPossible range for the “parenting relationship warmth score” is 1 to 4. Higher scores indicate greater relationship warmth in the parent-child relationship.

Table A.27. Parent report of their relationship with the child: Change from fall 2021 to spring 2022^a

		Fall 2021	Spring 2022	Fall-spring change ^{b,c}
	Unweighted total sample size (n)	Weighted percentage	Weighted percentage	Weighted percentage point difference
Parent and child have warm, close times together	501

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not

Table A.28 (continued)

assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aThis measure is from the Early Childhood Longitudinal Survey (ECLS) 2020 Field Test Preschool Parent Survey for the ECLS-Kindergarten 2023 Study.

^bAge as of September 1, 2021.

^c“Parenting relationship warmth score” is the average of six items that measure the extent to which statements about the parent’s relationship with the child are not true at all, somewhat true, mostly true, or completely true. Negatively worded items were reverse coded prior to calculating the average.

^dPossible range for the “parenting relationship warmth score” is 1 to 4. Higher scores indicate greater relationship warmth in the parent-child relationship.

Table A.29. Parents’ child care plans for next year

	Unweighted total sample size (n)	Weighted percentage
Child care plans for next year	913	
Child will attend kindergarten		48.1
Child will attend the same Head Start center		42.2
Child will attend another preschool		6.2
Child will attend a different Head Start center		2.1 [^]
Child care will be provided by a friend, neighbor, or family member (including a parent)		0.0 [^]
Another child care plan ^a		1.4 [^]
Among children not attending kindergarten or the same Head Start center next year, reason why parent is sending child someplace new^b	93	
Prepares child for kindergarten		55.2
Close to home		38.8
Know friend, neighbor, or family member (including a parent) who had also sent their child		25.7
Offers additional services for child and family ^c		17.1 [^]
Provides hours that fit parents schedule		13.4
Free of cost		13.0 [^]
Another reason ^d		13.8 [^]

Source: Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children. Some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^a“Another child care plan” includes examples such as enrolling the child in transitional kindergarten and homeschooling the child.

^bRespondents could select all reasons that applied.

^c“Offers additional services for child and family” includes examples such as services for child’s special needs or health screenings, or help accessing public assistance or job trainings.

^d“Another reason” includes examples such as homeschooling the child, private school, and the child’s being eligible for pre-K.

Source: Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 505 children. On each survey, some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

Fall 2021 data were collected from October 2021 to January 2022 and Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^a“In the last week” refers to the seven-day period leading up to the date the parent completed the survey; this 7-day period was during the COVID-19 pandemic. Children participated in virtual or remote educational and learning activities using a computer, phone, or tablet.

^bAsterisk (*) indicates if there is a statistically significant fall-spring change in the distribution of responses at the $p \leq .05$ level. There was not a statistically significant fall-spring change in the distribution of responses in this table.

^cA negative value for fall-spring change means a decrease in the level of agreement from fall to spring.

^dVirtual educational activities not required or suggested by the Head Start program include learning activities that children do on their own, such as ABC Mouse, educational videos, or educational games on a tablet.

^eHead Start virtual or remote learning activities include Head Start classes, activities, or assignments that are required or suggested by the Head Start program. These could include Zoom meetings with teachers, Ready Rosie, or Creative Curriculum take-home activities.

Table A.43. Parent preferences for mode of participation in Head Start activities

Source: Spring 2022 Parent Survey and Survey Management System.

Note: Statistics represent children enrolled in Head Start FACES programs in the 2021-2022 program year and whose parents agreed to participate in the Study. The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aItems come from the Mobilizing Resources Subscale from the Healthy Families Parenting Inventory (LeCroy et al. 2007).

^bAge as of September 1, 2021.

SECTION B

CHILDREN'S SOCIAL-EMOTIONAL AND LEARNING SKILLS

Return to description of [Section B](#) topics and composites.

This page has been left blank for double-sided copying.

Table B.1. Reliability of children’s lead teacher-reported social skills, problem behaviors, approaches to learning, and literacy skills raw scores, and of children’s parent-reported approaches to learning raw score

	Number of items administered	Cronbach’s alpha
Lead teachers’ report of children’s skills and behavior		
Social skills raw score ^a	12	0.91
Problem behaviors total raw score ^a	14	0.88
Aggressive behavior raw subscale score	4	0.87
Hyperactive behavior raw subscale score	3	0.78
Withdrawn behavior raw subscale score	6	0.78
Approaches to learning raw score (ECLS–K) ^b	6	0.93
Child literacy skills raw score ^c	6	0.67
Parents’ report of children’s behavior		
Approaches to learning raw score (ECLS–K) ^b	6	0.74

Source: Spring 2022 Teacher Child Report and Spring 2022 Parent Survey.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^a“Social skills raw score” and “problem behaviors raw score” items come from the Behavior Problems Index, the Personal Maturity Scale, and the Social Skills Rating Scale.

^bECLS–K=Early Childhood Longitudinal Study-Kindergarten Class of 1998–99.

^c“Child literacy skills raw score” items are adapted from the National Household Education Survey.

Table B.2. Children’s lead teacher-reported social skills, problem behaviors, and approaches to learning raw scores, and children’s parent-reported approaches to learning raw score

	Unweighted total sample size (n)	Weighted mean	SD	Reported range	Possible range
Lead teachers’ report of children’s behavior					
Social skills raw score ^a	784	18.2	5.14	0-24	0-24
Problem behaviors total raw score ^a	785	4.8	5.20	0-28	0-28
Aggressive behavior subscale raw score	786	1.5	2.08	0-8	0-8
Hyperactive behavior subscale raw score	784	1.4	1.70	0-6	0-6
Withdrawn behavior subscale raw score	784	1.4	2.10	0-12	0-12
Approaches to learning raw score (ECLS–K) ^b	785	2.9	0.76	1-4	1-4
Parents’ report of children’s behavior					
Approaches to learning raw score (ECLS–K) ^b	925	2.9	0.53	1-4	1-4

Source: Spring 2022 Teacher Child Report and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

For the teacher reported constructs, the n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 802 children. For the parent reported construct, the n column in this table includes the unweighted sample size to identify the number of children with valid data on the construct in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

SD=Standard deviation.

^a“Social skills raw score” and “problem behaviors raw score” items come from the Behavior Problems Index, the Personal Maturity Scale, and the Social Skills Rating Scale. For “social skills raw score,” higher scores indicate the child exhibits cooperative behaviors more frequently. For “problem behaviors raw score,” higher scores indicate the child exhibits negative behaviors more frequently.

^bECLS–K=Early Childhood Longitudinal Study-Kindergarten Class of 1998–99. Higher scores indicate the child exhibits positive approaches to learning behaviors more frequently.

Table B.3. Children’s lead teacher-reported social skills, problem behaviors, and approaches to learning raw scores, and children’s parent-reported approaches to learning raw score: Change from fall 2021 to spring 2022

	Unweighted total sample size (n)	Fall 2021	Spring 2022	Fall-spring change ^{a,b}
		Weighted mean (reported range ^e)	Weighted mean (reported range ^e)	Weighted mean difference (reported range ^{e,f})
Lead teachers’ report of children’s behavior				
Social skills raw score ^c	475	18.0 (0-24)	19.0 (0-24)	1.0* (-15-12)
Problem behaviors total raw score ^c	485	4.3 (0-26)	4.1 (0-25)	-0.2 (-15-25)
Aggressive behavior subscale raw score	487	1.4 (0-8)	1.5 (0-8)	0.1 (-7-8)
Hyperactive behavior subscale raw score	486	1.4 (0-6)	1.3 (0-6)	-0.1 (-3-6)
Withdrawn behavior subscale raw score	483	1.1 (0-10)	1.0 (0-10)	-0.1 (-7-9)
Approaches to learning raw score (ECLS–K) ^d	485	2.8 (1-4)	3.0 (1-4)	0.2* (-2-2)
Parents’ report of children’s behavior				
Approaches to learning raw score (ECLS–K) ^d	500	2.9 (1-4)	3.0 (1-4)	0.0 (-1-1)

Source: Fall 2021 and Spring 2022 Teacher Child Report and Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

For the teacher reported constructs, the n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 503 children. For the parent reported construct, the n column includes the unweighted sample size to identify the number of children with valid data on the construct in both fall 2021 and spring 2022 out of a maximum of 505 children.

Fall 2021 data were collected from October 2021 to January 2022 for the Teacher Child Report and October 2021 to January 2022 for the Parent Survey, during the COVID-19 pandemic. Spring 2022 data were collected from April 2022 to July 2022 for the Teacher Child Report and Parent Survey, during the COVID-19 pandemic.

^aAsterisk (*) indicates if there is a statistically significant fall-spring change in the distribution of responses at the $p \leq .05$ level.

^bA negative value for fall-spring change means a decrease in score from fall to spring.

^c“Social skills raw score” and “problem behaviors raw score” items come from the Behavior Problems Index, the Personal Maturity Scale, and the Social Skills Rating Scale.

^dECLS–K=Early Childhood Longitudinal Study-Kindergarten Class of 1998–99.

^ePossible range for the “social skills raw score” is 0 to 24; possible range for the “problem behaviors raw score” is 0 to 28 (possible ranges for raw subscores are as follows: “aggressive behavior” is 0 to 8, “hyperactive behavior” is 0 to 6, and “withdrawn behavior” is 0 to 12). For “social skills raw score,” higher scores indicate the child exhibits cooperative behavior more frequently. For “problem behaviors raw score,” higher scores indicate the child exhibits negative behavior more

Table B.3 (*continued*)

frequently. Possible score range for approaches to learning raw score is 1 to 4. Higher scores indicate the child exhibits positive approaches to learning behaviors more frequently.

^fAcross the constructs in this table, the change in scores between fall 2021 and spring 2022 were outliers for 3 to 9 children, meaning the difference in their responses between fall and spring was more than three standard deviations different from the average fall-spring change. This represents 0.6 to 1.8 percent of the sample. These outliers are included in the table and account for the large reported ranges for fall-spring change.

Table B.4. Children’s lead teacher-reported social skills, problem behaviors, and approaches to learning raw scores, by child age

	3 years old or younger ^a				4 years old or older ^a			
	Unweighted total sample size (n)	Weighted mean	SD	Reported range ^d	Unweighted total sample size (n)	Weighted mean	SD	Reported range ^d
Social skills raw score ^b	409	17.6	5.14	0-24	374	18.8	5.08	0-24
Problem behaviors total raw score ^b	412	4.9	5.17	0-28	372	4.8	5.25	0-25
Aggressive behavior subscale raw score	412	1.6	2.14	0-8	373	1.5	2.01	0-8
Hyperactive behavior subscale raw score	409	1.4	1.71	0-6	374	1.4	1.69	0-6
Withdrawn behavior subscale raw score	411	1.4	1.98	0-12	372	1.5	2.22	0-11
Approaches to learning raw score (ECLS–K) ^c	410	2.9	0.74	1-4	374	3.0	0.77	1-4

Source: Fall 2021 and Spring 2022 Teacher Child Report and Survey Management System.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 503 children.

Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aAsterisk (*) indicates a statistically significant fall-spring change in the distribution of responses at the $p \leq .05$ level.

^bA negative value for fall-spring change means a decrease in score from fall to spring.

^c“Social skills raw score” and “problem behaviors raw score” items come from the Behavior Problems Index, the Personal Maturity Scale, and the Social Skills Rating Scale.

^dECLS–K=Early Childhood Longitudinal Study-Kindergarten Class of 1998–99.

^ePossible range for the “social skills raw score” is 0 to 24; possible range for the “problem behaviors raw score” is 0 to 28 (possible ranges for raw subscores are as follows: “aggressive behavior” is 0 to 8, “hyperactive behavior” is 0 to 6, and “withdrawn behavior” is 0 to 12). For “social skills raw score,” higher scores indicate the child exhibits cooperative behavior more frequently. For “problem behaviors raw score,” higher scores indicate the child exhibits negative behavior more

Table B.7 (continued)

frequently. Possible score range for approaches to learning score is 1 to 4; higher scores indicate the child exhibits positive approaches to learning behaviors more frequently.

^fAcross the constructs in this table, the change in scores between fall 2021 and spring 2022 were outliers for 3 to 9 children, meaning the difference in their responses between fall and spring was more than three standard deviations different from the average fall-spring change. This represents 0.7 to 2.3 percent of the sample. These outliers are included in the table and account for the large reported ranges for fall-spring change.

^gAcross the constructs in this table, the change in scores between fall 2021 and spring 202 was an outlier for 1 child, meaning the difference in their responses between fall and spring was more than three standard deviations different from the average fall-spring change. This represents 0.3 percent of the sample. This outlier is included in the table and accounts for the large reported ranges for fall-spring change.

Table B.8. Children’s lead teacher-reported social skills, problem behaviors, and approaches to learning raw scores for newly entering children by age: Change from fall 2021 to spring 2022

	Newly entering children by age

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 503 children.

Table B.12 (continued)

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aAge as of September 1, 2021.

^bAsterisk (*) indicates a statistically significant fall-spring change in the distribution of responses at the $p \leq .05$ level.

^cA negative value for fall-spring change means a decrease in the frequency, level of agreement, or score from fall to spring.

^dAn example of the “relationship between sounds and letters” is when the letter B makes a “buh” sound.

^eThis item is adapted from the National Household Education Survey and is included in the “child literacy skills score.”

^fPossible scores range from 0 to 7; higher scores indicate the child exhibits greater literacy skills.

^gThe change in scores between fall 2021 and spring 2022 were outliers for 5 children, meaning the difference in their responses between fall and spring was more than three standard deviations different from the average fall-spring change. This represents 2 percent of the sample. These outliers are included in the table and account for the large reported ranges for fall-spring change.

^hThe change in scores between fall 2021 and spring 2022 were outliers for 3 children, meaning the difference in their responses between fall and spring was more than three standard deviations different from the average fall-spring change. This represents 1.2 percent of the sample. These outliers are included in the table and account for the large reported ranges for fall-spring change.

Table B.13. Children’s lead teacher-reported early literacy skills, by previous Head Start experience and for newly entering children by age

	Newly entering children by age				All newly entering children		All returning children

Source: Spring 2022 Teacher Child Report and Survey Management System.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 802 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

Table B.13 (continued)

Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aAge as of September 1, 2021.

^bAn example of the “relationship between sounds and letters” is when the letter B makes a “buh” sound.

^cThis item is adapted from the National Household Education Survey and is included in the “child literacy skills score.”

^dPossible scores range from 0 to 7; higher scores indicate the child exhibits greater literacy skills.

See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 503 children.

Table B.14 (continued)

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older.

^aAsterisk (*) indicates a statistically significant fall-spring change in the distribution of responses at the $p \leq .05$ level.

^bA negative value for fall-spring change means a decrease in the frequency, level of agreement, or score from fall to spring.

^cAn example of the “relationship between sounds and letters” is when the letter B makes a “buh” sound.

^dThis item is adapted from the National Household Education Survey and is included in the “child literacy skills score.”

^ePossible scores range from 0 to 7; higher scores indicate the child exhibits greater literacy skills.

^fThe change in scores between fall 2021 and spring 2022 were outliers for 7 children, meaning the difference in their responses between fall and spring was more than three standard deviations different from the average fall-spring change. This represents 1.7 percent of the sample.

^gThe change in scores between fall 2021 and spring 2022 was an outlier for 1 child, meaning the difference in their responses between fall and spring was more than three standard deviations different from the average fall-spring change. This represents 1.2 percent of the sample.

Source: Spring 2022 Teacher Child Report and Survey Management System.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 802 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aAge as of September 1, 2021.

^bThis item is from the Early Childhood Longitudinal Survey (ECLS) 2020 Field Test Preschool Parent Survey for the ECLS-Kindergarten 2023 Study.

^cLead teachers marked all responses that applied.

Source: Fall 2021 and Spring 2022 Teacher Child Report and Survey Management System.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 418 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older.

^aAge as of September 1, 2021.

^bAsterisk (*) indicates a statistically significant fall-spring change in the distribution of responses at the $p < .05$ level.

^cA negative value for fall-spring change means a decrease in the frequency or level of agreement from fall to spring.

^dThis item is from the Early Childhood Longitudinal Survey (ECLS) 2020 Field Test Preschool Parent Survey for the ECLS-Kindergarten 2023 Study.

^eLead teachers marked all responses that applied.

SECTION C

CHILDREN'S DISABILITY STATUS AND PHYSICAL HEALTH STATUS

Return to description of [Section C](#) topics and composites.

This page has been left blank for double-sided copying.

Table C.1. Children’s lead teacher-reported disability and IEP or IFSP status^a

	Unweighted total sample size (n)	Weighted percentage
Child has a disability or disabilities	796	
Yes		18.7
No		81.3
Among children with a disability or disabilities, type of disability	144	
Speech or language ^b		83.6
Cognitive ^c		34.2
Behavioral/emotional ^d		22.0
Physical ^e		6.4 [^]
Sensory ^f		1.4 [^]
Child has multiple disabilities^g	144

No		63.5
Child has an IEP or IFSP	142	
Yes		73.5
No		26.5

Source: Spring 2022 Teacher Child Report.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 802 children. Some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

IEP = Individualized Education Program. IFSP = Individual Family Service Plan.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aSurveys asked teachers whether a professional had indicated that the child had a developmental problem, delay, concern, or disability, and if so, to specify the developmental concern or disability.

^b“Speech or language” disability includes: speech impairment or difficulty communicating.

^c“Cognitive” disability includes: developmental delay, mental impairment, and autism or pervasive developmental delay.

^d“Behavioral/emotional” disability includes: behavior problems and hyperactivity, or attention deficit (ADD or ADHD).

^e“Physical” disability includes: motor impairment.

^f“Sensory” disability includes: deafness, hearing impairment/hard of hearing, blindness, and vision impairment.

^g“Child has multiple disabilities” includes children whose teachers have reported more than one of the five types of disability listed in the survey, including a speech or language, cognitive, behavioral/emotional, sensory, and/or physical disability.

Table C.2. Lead teacher report of children's receipt of services and how services were delivered, among children who have an IEP or an IFSP^a

	Unweighted total sample size (n)	Weighted percentage
Child received speech or language therapy	106	81.0
Services were delivered via direct teaching or by a specialist in another classroom or setting	103	74.4
Lead teacher participated in the IEP or IFSP meeting	108	63.7
Services were delivered via direct teaching or by a specialist in the classroom	103	42.6
Child received special education teacher services	106	32.9
Services were delivered via consultation	103	28.1
Child received social work services	106	10.4 [^]
Child received psychological services	106	9.7 [^]
Services were delivered via direct teaching or services by a specialist virtually	103	4.3 [^]
Child received other services	105	3.1 [^]

Source: Spring 2022 Teacher Child Report.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 109 children.

Estimates include only children with an IEP or IFSP. We exclude 26.5 percent of children who do not have an IEP or IFSP.

IEP = Individualized Education Program. IFSP = Individual Family Service Plan.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

^aSurveys asked teachers what had been done thus far in the program year at the time of survey completion to address the child's condition or concerns about the child's health and development. The survey defined an IFSP and IEP as a written plan that describes goals for this child and the services they should receive.

Table C.3. Parent-reported child health status

	Weighted percentage (unweighted n = 927)
Excellent	63.0
Very good	23.2
Good	12.7
Fair	1.2 [^]
Poor	0.0

Source: Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The unweighted sample size identifies the number of children with valid data on the construct in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

[^] Interpret data with caution. Estimate is unreliable because the standard error represents more than 30 percent of the estimate.

Table C.4. Parent-reported child health status: Change from fall 2021 to spring 2022

	Fall 2021	Spring 2022	Fall-spring change ^{a,b}
	Weighted percentage (unweighted n = 501)	Weighted percentage (unweighted n = 501)	Weighted percentage point difference (unweighted n = 501)
Excellent	50.8	63.1	12.3*
Very good	31.6	23.3	-8.2*
Good	15.3	12.4	-2.9
Fair	2.2	1.1	-1.1
Poor	0.0	0.0	0.0

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The unweighted sample size identifies the number of children with valid data on the construct in both fall 2021 and spring 2022 out of a maximum of 505 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aAsterisk (*) indicates a statistically significant fall-spring change in the distribution of responses at the $p \leq .05$ level. This change may occur in any of the five categories ("excellent," "very good," "good," "fair," and "poor").

^bA negative value for fall-spring change means a decrease in health status from fall to spring.

SECTION AA

STANDARD ERRORS FOR CHILDREN'S CHARACTERISTICS, FAMILY BACKGROUND, AND HOME ENVIRONMENT

Return to description of [Section A](#) topics and composites.

This page has been left blank for double-sided copying.

Table AA.1. Standard errors for children's demographic characteristics

	Unweighted total sample size (n)	SE

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information. The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children. Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older. Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aAge as of September 1, 2021.

^b“Another race, non-Hispanic” includes respondents who did not fit into a category included in the table. These races/ethnicities were categorized as “Another race, non-Hispanic” due to the small number of respondents.

^cRespondents could select all gender identities that applied.

Table AA.4. Standard errors for languages spoken in the home and the language always or usually spoken to the child in the home

	Unweighted total sample size (n)	SE
All languages spoken in the home^a	1,147	
English		2.16
Spanish		2.87
Another language ^b		5.53
Language that is always or usually spoken to the child in the home^c	1,150	
English		3.99
Spanish		1.67
Another language ^b		3.18
Language that is always or usually spoken to the child in the home is used for classroom instruction^d	786	
Yes		4.73
No		4.73

Source: Fall 2021 and Spring 2022 Parent Survey and Spring 2022 Teacher Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample size to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children. The unweighted sample size for match between home and classroom language is lower because that construct requires a child to have an associated Fall 2021 or Spring 2022 Parent Survey, and a completed Spring 2022 Teacher Survey.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aThe study based this on the parent's report of languages spoken in the home; respondents could select all languages that the family speaks.

^b"Another language" includes examples of non-Spanish languages such as Farsi and Portuguese. These languages were categorized as "Another language" due to the small number of respondents.

^cParents could report using more than one language in the home. If they reported using only one language in the home, we considered that to be the language always spoken to the child in the home. If parents reported using more than one language in the home, we asked about and used the language that is usually spoken to the child.

^dThe study based this on the lead teacher's report of the language(s) used for instruction in the classroom, as well as the parent's report of the language that is always or usually spoken to the child at home. More information on the Spring 2022 Teacher Survey is available in N. Reid et al. (2024).

Table AA.5. Standard errors for child’s primary caregiver, parent marital status, and who was living in the child’s household^a

	Unweighted total sample size (n)	SE
Child’s primary caregiver	926	
One biological or adoptive parent		2.44
Two biological or adoptive parents		2.09
One biological or adoptive parent and one non-biological or non-adoptive parent		0.77
Biological or adoptive grandparent(s) without parents		0.71
Two non-biological or non-adoptive parents		0.00
Another primary caregiver ^b		1.60
Marital status of two-parent households	376	
Married		5.69
Unmarried		4.70
Registered domestic partnership or civil union		1.39
Marital status of all households	842	
Married		3.90
Unmarried		3.78
Registered domestic partnership or civil union		0.65
Child was living with temporary household members^c	924	
Yes		0.94
No		0.94
Child was living with grandparent and/or great grandparent^d	927	
Yes, with parent(s) in the household		6.4
Yes, without parent(s) in the household		2.6
No		1.91
Mean number of people in household^e	928	0.05

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children. Some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aThis table focuses on biological or adoptive caregivers and does not include other adults, such as parents’ romantic partners or foster parents. Thus, for example, the “One biological or adoptive parent” category indicates that the biological or adoptive parent is the only biological or adoptive parent in the household; it does not mean the parent is the only adult in the household.

^b“Another primary caregiver” includes examples such as stepparent without a biological parent and households with more than two parents. These caregivers were categorized as “Another primary caregiver” due to the small number of respondents.

^c“Temporary household members” include someone who usually lives somewhere else but is staying in the household for the time being.

Table AA.5 (*continued*)

^dThis category includes children living with and without their biological or adoptive parent(s).

^e“Number of people” includes anyone who normally lives in the household with the child (including relatives and non-relatives).

Table AA.6. Standard errors for level of education parents completed^a

	Unweighted total sample size (n)	SE
Highest level of education of parent(s) in the household^b	1,094	
Less than high school diploma		1.36
High school diploma or GED		2.17
Some college/vocational/technical/Associate degree		1.56
Bachelor’s degree or higher		2.23
Level of education of mother(s) in the household^c	1,068	
Less than high school diploma		1.45
High school diploma or GED		1.42
Some college/vocational/technical/Associate degree		1.85
Bachelor’s degree or higher		1.35
Level of education of father(s) in the household^d	413	
Less than high school diploma		4.69
High school diploma or GED		4.04
Some college/vocational/technical/Associate degree		3.13
Bachelor’s degree or higher		4.36

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aData include households with at least one biological or adoptive parent. We exclude the 4.5 percent of children whose households do not include a biological or adoptive parent.

^b“Highest level of education of parent(s) in the household” includes children with one or two biological or adoptive parents in the household and the highest education level among them when there are two parents. If there is only one parent, the “highest level of education of parent(s) in the household” reflects that parent.

^c“Level of education of mother(s) in the household” includes children with a biological or adoptive mother in the household, whether alone or with another parent, and all mothers in households.

^d“Level of education of father(s) in the household” includes children with biological or adoptive a father in the household, whether alone or with another parent, and all fathers in households.

Table AA.7. Standard errors for parent's employment status^a

	Unweighted total sample size (n)	SE
Employment status of parent(s) in the household^b	1,041	
Two parents working full time		1.12
Single parent working full time		3.43
One parent working full time; one parent working part time or less		2.00
Two parents working part time or less		1.50
Single parent working part time or less		2.48
Employment status of mother(s) in the household^c	1,077	
Full-time		3.69
Part-time		2.61
Looking for work		1.48
Not in labor force		2.13
Employment status of father(s) in the household^d	447

Not in labor force		1.91

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in fall 2021 or spring 2022 out of a maximum of 1,159 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aData include households with at least one biological or adoptive parent. We exclude the 4.5 percent of children whose households do not include a biological or adoptive parent.

^b"Employment status of parent(s) in the household" includes children with one or two biological or adoptive parents in the household and the highest employment level among them when there are two parents. If there is only one parent, the "employment status of parent(s) in the household" reflects that parent.

^c"Employment status of mother(s) in the household" includes children with a mother in the household, whether alone or with another parent. Percentages may sum to more than 100 because there are households with more than one biological or adoptive mother.

^d"Employment status of father(s) in the household" includes children with a father in the household, whether alone or with another parent. Percentages may sum to more than 100 percent because there are households with more than one biological or adoptive father.

Table AA.8. Standard errors for total household income in the past 12 months^a

	Unweighted total sample size (n)	SE
Annual household income (categories)	928

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aThis table summarizes household income. Readers should not use it to estimate eligibility for Head Start. Head Start qualifying criteria use family (not household) income. There are also other (non-income) ways to qualify for the program. Household income reported in this table includes all contributions from members of the household, safety net programs, and other sources of income such as rental income, interest, and dividends. This does not include stimulus payments from the government.

^bTo lessen the effect of a small number of respondents who reported annual incomes higher than \$75,000, we limit the annual household income at a maximum of \$75,000.

Table AA.9. Standard errors for total household income in the past 12 months: Change from fall 2021 to spring 2022^a

None		1.56
One		1.50
Two		0.21
Three or more		0.46
Among families that moved at least once in the last 12 months, the main reason for the most recent move	134	
For a job or schooling		5.31
Could not afford prior home		6.67
To be closer to family or friends		2.82
To lower living expenses		3.41
Escape domestic abuse		2.58
Moved in with partner or spouse		1.47
Prior landlord sold housing		2.87
Housing was destroyed		1.88
Was evicted		1.62
Safer community		0.71
Family or friends no longer willing to house them		0.71
Time limit up for transitional housing		0.73
More space		0.33
Another reason ^c		5.65

Source: Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children. Some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

Spring 2022 data were collected from April 2022 through July 2022, during the COVID-19 pandemic.

^aThese responses were mutually exclusive; respondents were only able to select one of the three response options.

^b“Another housing situation” includes examples such as living in a camper or mobile home.

^c“Another reason” includes examples such as divorce or becoming a homeowner. These reasons were categorized as “Another reason” due to the small number of respondents.

Table AA.12. Standard errors for parents' feelings about their housing conditions

	Unweighted total sample size (n)	SE
Housing is just the right size	1,152	
Strongly disagree		1.15
Disagree		1.57
Neutral		1.42
Agree		1.94
Strongly agree		1.58
Housing is crowded	1,152

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

**Table AA.20. Standard errors for parents' health status:
Change from fall 2021 to spring 2022**

	Fall 2021	Spring 2022	Fall-spring change
	SE (unweighted n = 501)	SE (unweighted n = 501)	SE (unweighted n = 501)
Excellent	2.14	2.97	3.22
Very good	2.88	3.01	3.88
Good	3.43	2.63	3.85
Fair	2.47	2.01	2.38
Poor	1.00	0.56	1.23

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The unweighted sample size identifies the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 505 children. Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

Table AA.31 (*continued*)

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^a“Another strategy” category includes examples such as caring for their child while working from home, relying on a babysitter, and using church day care services.

Table AA.32. Standard errors for strategies the parent used to meet child care needs outside of their regular child care arrangements, by previous Head Start experience and for newly entering children by age

	Newly entering children by age							
	3-year-olds ^a		4-year-olds ^a		All newly entering children		All returning children

However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children. Some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^a“In the last week” refers to the seven-day period leading up to the date the parent completed the survey; this 7-day period was during the COVID-19 pandemic. Children participated in virtual or remote educational and learning activities using a computer, phone, or tablet.

^bVirtual or remote educational activities not required or suggested by the Head Start program include learning activities that children do on their own, such as ABC Mouse, educational videos, or educational games on a tablet.

Table AA.41 (*continued*)

^cHead Start virtual or remote learning activities include Head Start classes, activities, or assignments that are required or suggested by the Head Start program. These could include Zoom meetings with teachers, Ready Rosie, or Creative Curriculum take-home activities.

Table AA.42. Standard errors for parent report of child’s participation in virtual learning activities in the last week: Change from fall 2021 to spring 2022^a

	Fall 2021		Spring 2022		Fall-spring change
	Unweighted total sample size (n)	SE	Unweighted total sample size (n)	SE	SE

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 505 children. On each survey, some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

Fall 2021 data were collected from October 2021 to January 2022 and Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^a“In the last week” refers to the seven-day period leading up to the date the parent completed the survey; this 7-day period was during the COVID-19 pandemic.” Children participated in virtual or remote educational and learning activities using a computer, phone, or tablet.

^bVirtual educational activities not required or suggested by the Head Start program include learning activities that children do on their own, such as ABC Mouse, educational videos, or educational games on a tablet.

^cHead Start virtual or remote learning activities include Head Start classes, activities, or assignments that are required or suggested by the Head Start program. These could include Zoom meetings with teachers, Ready Rosie, or Creative Curriculum take-home activities.

Note: Statistics represent children enrolled in Head Start FACES programs in the 2021-2022 program year and whose parents agreed to participate in the Study. The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child to participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 928 children.

Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aItems come from the Mobilizing Resources Subscale from the Healthy Families Parenting Inventory (LeCroy et al. 2007).

^bAge as of September 1, 2021.

SECTION BB

STANDARD ERRORS FOR CHILDREN'S SOCIAL-EMOTIONAL AND LEARNING SKILLS

Return to description of [Section B](#) topics and composites.

This page has been left blank for double-sided copying.

Table BB.2. Standard errors for children’s lead teacher-reported social skills, problem behaviors, and approaches to learning raw scores, and children’s parent-reported approaches to learning raw score

	Unweighted total sample size (n)	SE
Lead teachers’ report of children’s skills and behavior		
Social skills raw score ^a	784	0.40
Problem behaviors total raw score ^a	785	0.33
Aggressive behavior subscale raw score	786	0.10
Hyperactive behavior subscale raw score	784	0.09
Withdrawn behavior subscale raw score	784	0.13
Approaches to learning raw score (ECLS–K) ^b	785	0.07
Parents’ report of children’s behavior		
Approaches to learning raw score (ECLS–K) ^b	925	0.03

Source: Spring 2022 Teacher Child Report and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

For the teacher reported constructs, the n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 802 children. For the parent reported construct, the n column in this table includes the unweighted sample size to identify the number of children with valid data on the construct in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^a“Social skills raw score” and “problem behaviors raw score” items come from the Behavior Problems Index, the Personal Maturity Scale, and the Social Skills Rating Scale. For “social skills raw score,” higher scores indicate the child exhibits cooperative behaviors more frequently. For “problem behaviors raw score,” higher scores indicate the child exhibits negative behaviors more frequently.

^bECLS–K=Early Childhood Longitudinal Study-Kindergarten Class of 1998–99. Higher scores indicate the child exhibits positive approaches to learning behaviors more frequently.

Table BB.3. Standard errors for children's lead teacher-reported social skills, problem behaviors, and approaches to learning raw scores, and children's parent-reported approaches to learning raw score: Change from fall 2021 to spring 2022

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 503 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aAge as of September 1, 2021.

^b“Social skills raw score” and “problem behaviors raw score” items come from the Behavior Problems Index, the Personal Maturity Scale, and the Social Skills Rating Scale.

Source: Spring 2022 Teacher Child Report and Survey Management System.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 802 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

Estimates for previous Head Start experience by age are only reported for newly entering children. Only 12 percent of the children in the sample were returning children and most returning children (73.2 percent) were age 4 or older.

^aAge as of September 1, 2021.

^bAn example of the “relationship between sounds and letters” is when the letter B makes a “buh” sound.

^cThis item is adapted from the National Household Education Survey and is included in the “child literacy skills score.”

Table BB.19 (continued)

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n columns in this table include unweighted sample sizes to identify the number of children with valid data on each of the constructs in both fall 2021 and spring 2022 out of a maximum of 503 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aAge as of September 1, 2021.

^bThis item is from the Early Childhood Longitudinal Survey (ECLS) 2020 Field Test Preschool Parent Survey for the ECLS-Kindergarten 2023 Study.

^cLead teachers marked all responses that applied.

Child has an IEP or IFSP	142	
Yes		5.51
No		5.51

Source: Spring 2022 Teacher Child Report.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information. The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 802 children. Some items were only asked of a subsample of respondents, so these items have a smaller maximum sample size.

IEP = Individualized Education Program. IFSP = Individual Family Service Plan.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aSurveys asked teachers whether a professional had indicated that the child had a developmental problem, delay, concern, or disability, and if so, to specify the developmental concern or disability.

^b"Speech or language" disability includes: speech impairment or difficulty communicating.

^c"Cognitive" disability includes: developmental delay, mental impairment, and autism or pervasive developmental delay.

^d"Behavioral/emotional" disability includes: behavior problems and hyperactivity, or attention deficit (ADD or ADHD).

^e"Physical" disability includes: motor impairment.

^f"Sensory" disability includes: deafness, hearing impairment/hard of hearing, blindness, and vision impairment.

^g"Child has multiple disabilities" includes children whose teachers have reported more than one of the five types of disability listed in the survey, including a speech or language, cognitive, behavioral/emotional, sensory, and/or physical disability.

Table CC.2. Standard errors for lead teacher report of children’s receipt of services and how services were delivered, among children who have an IEP or an IFSP^a

	Unweighted total sample size (n)	SE
Child received speech or language therapy	106	7.02
Services were delivered via direct teaching or by a specialist in another classroom or setting	103	7.95
Lead teacher participated in the IEP or IFSP meeting	108	9.02
Services were delivered via direct teaching or by a specialist in the classroom	103	8.63
Child received special education teacher services	106	7.26
Services were delivered via consultation	103	7.69
Child received social work services	106	4.09
Child received psychological services	106	4.32
Services were delivered via direct teaching or services by a specialist virtually	103	3.05
Child received other services	105	2.35

Source: Spring 2022 Teacher Child Report.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The n column in this table includes unweighted sample sizes to identify the number of children with valid data on each of the constructs in spring 2022 out of a maximum of 109 children.

Estimates include only children with an IEP or IFSP. We exclude 26.5 percent of children who do not have an IEP or IFSP.

IEP = Individualized Education Program. IFSP = Individual Family Service Plan.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

^aSurveys asked teachers what had been done thus far in the program year at the time of survey completion to address the child’s condition or concerns about the child’s health and development. The survey defined an IFSP and IEP as a written plan that describes goals for this child and the services they should receive.

Table CC.3. Standard errors for parent-reported child health status

	SE (unweighted n = 927)
Excellent	2.38
Very good	2.53
Good	1.43
Fair	0.40
Poor	0.00

Source: Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The unweighted sample size identifies the number of children with valid data on the construct in spring 2022 out of a maximum of 928 children.

Spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.

Table CC.4. Standard errors for parent-reported child health status: Change from fall 2021 to spring 2022

	Fall 2021	Spring 2022	Fall-spring change

Source: Fall 2021 and Spring 2022 Parent Survey.

Note: The data are weighted to adjust for the probability of selection. They are also weighted, to the extent possible, to account for (1) programs that chose not to participate, (2) parents who did not consent to have their child participate in the study, and (3) nonresponse to the parent survey and/or TCR (among children whose parents consented for their child to participate in the study). However, given lower than expected response rates, readers should not assume the data are nationally representative of children enrolled in Head Start programs in the 2021-2022 program year. See pages 9-11 for more information.

The unweighted sample size identifies the number of children with valid data on the construct in both fall 2021 and spring 2022 out of a maximum of 505 children.

Fall 2021 data were collected from October 2021 to January 2022, and spring 2022 data were collected from April 2022 to July 2022, during the COVID-19 pandemic.
